

## BOLLETTINO MENSILE - GENNAIO 1922

## INDICE

Diario delle condizioni meteorologiche ed idrografiche per le Venezie (esclusa la Giulia) . . . . . pag. 2

## ELEMENTI METEOROLOGICI OSSERVATI NELLE VENEZIE

ord. = ordine    aerol. = Stazione aerologica    princ. = Osservatorio principale

Osservatorio di:		Osservatorio di:	
Bassano (2° ord.) . . . . .	pag. 10	Rovigo (1° ord.) . . . . .	pag. 16
Belluno (2° ord.) . . . . .	8	Trento (1° ord.) . . . . .	13
Bolzano (1° ord.) . . . . .	12	Trieste (1° ord.-aerol.) . . . . .	4
Colle Venda (1° ord.) . . . . .	21	Udine (1° ord.-aerol.) . . . . .	6
Gorizia (2° ord.) . . . . .	5	Venezia (princ.-aerol.) . . . . .	14, 19, 20
Padova (1° ord.-aerol.) . . . . .	15	Verona <del>Staz. Met.</del> (1° ord.-aer.) . . . . .	13
Pola (1° ord.) . . . . .	4	Vicenza (1° ord.) . . . . .	11

## ELEMENTI METEOROLOGICI ED IDROGRAFICI

## RELATIVI A CIASCUN BACINO FLUVIALE

Venezia Giulia . . . . .	pag. 4	Bacino del Bacchiglione . . . . .	pag. 11
Bacino dell'Isonzo . . . . .	5	» dell'Agno Guà . . . . .	11
» della Drava . . . . .	6	» dell'alto Adige . . . . .	12
» del Tagliamento . . . . .	6	» del medio e basso Adige . . . . .	13
» della Livenza . . . . .	7	» del Po (Sarca e Mincio) . . . . .	14
» della Piave . . . . .	8	Alta pianura occidentale . . . . .	14
Pianura orientale . . . . .	9	Bassa pianura occidentale . . . . .	15
Bacino della Brenta . . . . .	10	Pianura polesana . . . . .	16

## PLUVIOMETRIA E NIVOMETRIA

Precipitazioni giornaliere (vedi gli elementi idrografici per ciascun bacino).  
La situazione isobarica e le vicende atmosferiche con speciale riguardo alle precipitazioni . . . . . pag. 17

## SECCHENZA DEL TERRENO

(Vedi gli elementi idrografici per ciascun bacino).

## REGIME DEI CORSI D'ACQUA

Altezze giornaliere del livello ai principali idrometri dei corsi d'acqua (vedi gli elementi idrografici per ciascun bacino).  
Notizie sulle piene e sulle magre dei fiumi. — Le magre del Tagliamento, della Brenta e dell'Adige durante il mese — Confronti con le magre del Tagliamento, della Brenta e dell'Adige avvenute durante i mesi di gennaio del periodo 1911-20 . . . . . pag. 18  
Deflussi giornalieri e mensili, per il Boite a Perarolo, per la Brenta a Sarson, per l'Adige a Pescantina e Boara Pisani, per il Mincio a Peschiera . . . . . 3  
Materiale in sospensione nell'acqua dei fiumi (Tagliamento a Venzona, Piave a Belluno, Brenta a Stra, Adige a Pescantina) . . . . . 22  
Portata giornaliera del pozzo artesiano a Stra . . . . . 22  
Misure di portata eseguite nel mese . . . . . 22

## MAREOGRAFIA

Ore ed altezze delle alte e basse maree nel mese a Pola, Trieste e Diga Sud Lido (in mare aperto) . . . . . pag. 23  
Notizie sulle maree e fenomeni concomitanti . . . . . 24  
Ondulazioni secondarie . . . . . 24

## SEGNI CONVENZIONALI

(n), precipitazioni avvenute sotto forma di neve non misurata;  
m, la stazione manda soltanto il totale mensile delle precipitazioni;  
\*\*, lo strumento non ha funzionato;  
\*\*\*, strumento guasto;  
\*, non giunte le osservazioni - dato mancante o non calcolato;

?, dato incerto;  
(°), dato desunto dallo strumento a lettura diretta, invece che dal registratore;  
=, dato interpolato o calcolato in base ad osservazioni interpolate;  
\*, pluviografo, idrometrografo;

+, pluviometro-nivometro: nei totali sono considerate anche le precipitazioni avvenute sotto forma di neve;  
°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione.

AVVERTENZE. — I valori massimi e minimi sono indicati col carattere grassetto per la parte meteorologica e ponendo i dati fra parentesi per la parte idrometrica.  
Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere ordinario sono sopra lo zero idrometrico; quelle stampate in carattere minuscolo sono sotto lo zero idrometrico.

## Diario delle condizioni meteorologiche e idrografiche per le Venezie (esclusa la Giulia)

Gli Osservatori considerati nel presente specchio sono i seguenti: Gorizia (Ginnasio Dante Alighieri), Udine (Castello), Belluno (Villa Ricci), Bassano (Ginnasio Comunale), Vicenza (Accademia Olimpica), Bolzano (Ginnasio superiore dei Francescani), Trento (R. Magistrato alle Acque), Bosco Mantico (Verona) (Cantieri aeronautici), Venezia (R. Magistrato alle Acque), Padova (R. Magistrato alle Acque), Rovigo (Seminario vescovile).

La Venezia Giulia ha caratteristiche meteorologiche proprie molto diverse dalle due altre Venezie e non può essere considerata in un'unica tabella riassuntiva.

(1) Le temperature indicate si intendono non ridotte al livello del mare e rappresentano i valori massimo e minimo rispettivamente fra le temperature massima e minima osservate nei diversi Osservatori.

(2) Segni convenzionali: c = vento con direzione costante; i = vento con direzione variabile da osservatorio ad osservatorio; r = intera regione veneta; m = regione montana; p = pianura.

(3) La velocità del vento in questa colonna è espressa in gradi come segue: 0 grado = calma (inferiore a 1 km. all'ora); 1° grado = da 1 a 5 km. all'ora; 2° grado = da 5 a 10 km. all'ora; 3° grado = da 10 a 15 km. all'ora; ecc.

(4) Il numero che precede il tipo isobarico si riferisce alla classificazione che trovasi nell'8 relazione annuale del Direttore (pubbl. n. 84 dell'Ufficio).

(5) Quando occorre specificare la quale bacino sono avvenute precipitazioni, vengono generalmente usate le seguenti abbreviazioni: I. = Isonzo; T. = Tagliamento; L. = Livenza; P. = Piave; p. o. = pianura orientale; Br. = Brenta; Ba. = Bacchiglione; Ag. = Agno; A. A. = Alto Adige; M. A. = Medio Adige; p. occ. = pianura occidentale; p. pol. = pianura polesana. Gli altri fenomeni meteorologici vengono dati per osservatorio, usando generalmente le seguenti abbreviazioni: G. = Gorizia; Ud. = Udine; Bl. = Belluno; Bas. = Bassano; Vic. = Vicenza; Bz. = Bolzano; Trt. = Trento; B. M. = Bosco Mantico; Ven. = Venezia; P. = Padova; R. = Rovigo.

(6) Per indicare i corsi d'acqua, oltre alle abbreviazioni suesposte vengono adoperate anche le seguenti: S. = Sile; Fr. = Frassin; Go. = Gorvone; Fl. = Fratta; Pl. = Po di Levante. Per lo stato dei fiumi si adoperano i seguenti segni convenzionali: f. m. = forte magra; m. = magra; d. m. = debole morbida; M. = morbida; M. a. = morbida accentuata; p. = piena; f. p. = forte piena.

(7) Abbreviazioni: Pr. = Promontorio; Sc. = Saccatura; Sl. = Sella; Pd. = Pendio; Depr. = Depressione; AP. = Alta pressione; C. = Ciclone; CS. = Ciclone secondario; AC. = Anticiclone.

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Boite a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Mincio a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richiesto per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero, ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24 ore. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene dedotta mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbida media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Per avere l'effettivo contributo in litri per km.<sup>2</sup> deve essere però anche considerata la portata del canale di derivazione per l'irrigazione dell'alto Agro Veronese, che non è compresa nella portata misurata a Pescantina.

(2) Per ottenere l'effettivo contributo in litri per km.<sup>2</sup> deve essere considerata anche l'acqua derivata nell'Adigetto a Badia Polesine e le derivazioni minori. Le indicazioni per tenerne conto saranno pubblicate in uno dei prossimi bollettini.

## Elementi per la conoscenza della secchezza del terreno

Giorni senza pioggia	1	2	3	4	5	6	7	8	9	10	11	12	—	1	2	—	—	—	—	1	2	3	4	5	6	7	—	—	—	1	2	—				
Piovos. media in gradi (3)	—	—	—	—	—	—	—	—	—	—	—	2	—	—	4	1	1	1	—	—	—	—	—	—	—	—	1	1	—	—	1	4				
Secchezza del terreno	secco				molto secco								secco				um.				secco				molto secco				secco				um.			

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche" e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Per variazione della pressione va intesa la differenza (in mm.) della pressione alle ore 0 e alle ore 24. Tale valore è accompagnato dalle seguenti abbreviazioni: a = aumento; d = diminuzione; r = regolare; i = irregolare; c = la pressione si mantiene quasi costante ed è soggetta alla sola variazione giornaliera.

(2) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Pola = +0°2; Osservatorio di Trieste = 0. Per ottenere la temperatura osservata, tali coefficienti vanno sottratti dal valore della temperatura media riportato nelle tabelle. Per esempio, la temperatura media vera del giorno 1 a Pola è di 6°1 - 0°2 = 5°9 che è quella dedotta dalle osservazioni.

(3) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

Caporetto . . .	197	0.52	0.52	0.52	0.52	0.51	0.51	0.51	0.51	0.51	0.54	0.50	0.50	0.50	0.50	0.50	0.50	0.50	0.50	0.50	0.50	0.50	0.49	0.49	0.49	0.49	0.49	0.49	0.49	0.49	0.49	0.50	0.05	0.45	1.50	5.18

**B** = Osservazioni meridiane del livello alle stazioni idrometriche

[illegible]

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1). **Abbreviazioni:** a = aumento; d = diminuzione; r = regolare; i = irregolare; c = la pressione si mantiene quasi costante ed è soggetta alla sola variazione giornaliera. (V. pag. 4).

(1) Abbreviazioni: a = aumento; d = diminuzione; r = regolare; i = irregolare, e = la pressione si mantiene quasi costante ed è soggetta ad una sola variazione graduale.  
(2) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Trento = + 1°7; Osservatorio di Bosco Mantico = + 0°4. (Vedi esempio a pag. 4).  
(3) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

(8) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

(4) Le osservazioni vennero eseguite alle ore 8.

(5) Dal giorno 9 al 22 le osservazioni idrometriche non sono regolari: il fiume è coperto da uno strato di ghiaccio.

Montebelluna

**B** = Osservazioni meridiane del livello alle stazioni idrometriche

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Abbreviazioni: a = aumento; d = diminuzione; r = regolare; i = irregolare; c = la pressione si mantiene quasi costante ed è soggetta alla sola variazione giornaliera (Vedi pag. 4).

(2) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Rovigo = + 0°1 (Vedi esempio a pag. 4).

(8) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

## La situazione isobarica e le vicende atmosferiche con speciale riguardo alle precipitazioni.

### 1. Diario delle condizioni idrografiche e meteorologiche del mese (vedi pag. 2).

Al primo del mese troviamo ancora accentuato l'Anticiclone Atlantico delle Azzorre, che con la sua espansione sull'Europa centrale aveva difeso la nostra regione dalle influenze cicloniche, ma esso, in seguito, va progressivamente raccogliendosi verso SW, mentre i cicloni provenienti dalla Groenlandia e dall'Islanda riescono ad estendere la loro azione sull'Italia girando la catena alpina da levante.

Notevole il valore e la rapidità della discesa del barometro in questi primi giorni: a Venezia da mm. 767.5 il 1°, il barometro passa a 744.4 il 4, a 744.6 il 5, per poi tornare a salire con sufficiente rapidità. Tale diminuzione va connessa con la vasta area ciclonica che ha un nucleo a levante d'Italia e un altro, il 4, nell'Italia meridionale. Può sembrare singolare che a tanta diminuzione non sia corrisposto un cambiamento di tempo sensibile, ma questo, probabilmente, va ascrivito a ciò che la traiettoria del ciclone principale in tutto il suo percorso, sia nella parte settentrionale, come in quella orientale, si svolse molto lontana da noi; a tutto ciò va aggiunto che al 4, mentre il nucleo del Ciclone principale trovavasi sul golfo di Finlandia, nell'Italia meridionale si sviluppava un Ciclone secondario che provocò nella nostra regione venti settentrionali.

La situazione europea dal 4 al 6 si può riassumere: Pressioni elevate sulle coste Atlantiche che interessavano la parte occidentale del continente Europeo, pressioni basse nella parte orientale. Al 7 le linee generali della situazione subiscono una notevole modificazione: la configurazione ricorda una gran Sella, col suo centro sulla Polonia, questo centro al giorno 8 passa sul golfo di Lione. Tale configurazione era derivata dalla scissione in due parti (un Anticiclone sulle Azzorre, l'altro sull'Europa Nord orientale) delle alte pressioni atlantiche e dell'Europa centrale, scissione provocata dall'approdare di un potente Ciclone sull'Islanda; a questo corrisponde altro Ciclone nel Mediterraneo meridionale. Dopo una breve ricongiunzione dei due Anticicloni al 12 e al 13, al 14 torna nuovamente la loro separazione che, più o meno accentuata, dura, salvo breve interruzione il 19-20, sino alla fine del mese, e la configurazione generale europea ricorda, sempre i lineamenti di una grande Sella.

La striscia di bassa pressione che dalla Groenlandia, attraverso l'Inghilterra e la Francia, raggiunge il Mediterraneo, al 15 si allarga e in Algeria si delinea un Ciclone. Con questa modifica nella situazione Europea si inizia il periodo piovoso che dura sino al 18. Al 19, con l'estendersi del promontorio sospinto dall'Anticiclone settentrionale, sino a toccare altro promontorio, prolungamento dell'anticiclone delle Azzorre, e con l'allontanarsi verso il basso Tirreno del ciclone mediterraneo, il tempo si rasserenava.

Da noi continua il sereno anche nei giorni successivi quando allo scindersi della striscia d'alta pressione, il Ciclone dell'Atlantico attraverso il Golfo di Guascogna riesce ad insinuarsi nel basso Mediterraneo.

Dal 25 al 28 si ha una serie di configurazioni del tipo II°: le isobare che racchiudono le alte pressioni dell'Europa orientale e occidentale si adattano alla catena alpina e alla Val Padana (talora si insinuano in questa seguendovi bene i contorni, come il 24, il 25, il 26), delle depressioni si stendono sull'Europa occidentale e sul Mediterraneo occidentale. La pressione che, nella nostra regione è cresciuta nei primi due giorni, è diminuita in seguito, ossia a partire dal 25; dal qual giorno si inizia il periodo piovoso. Difatti a Venezia nei giorni

22 23 24 25 26 27 28 29 30 31 la pressione è di mm. 765.4 766.6 768.6 767.0 762.4 764.7 759.1 758.3 757.4 750.1

Nel 29, con lo stabilirsi di un gradiente da Nord sulla nostra regione (tipo XVIII), le precipitazioni mancano, per riprendere generali e abbastanza copiose nei giorni successivi coi tipi IV e III. Non si tratta però del tipo III caratteristico della classificazione; le isobare non corrono così regolarmente da costituire sul Mediterraneo un largo pendio da Sud; esse si scostano da tale forma particolarmente sulle Alpi, dando luogo a una specie di promontorio da Est. Tuttavia la direzione media del gradiente, il valore basso della pressione e l'ubicazione del centro non solo non permettono nessun'altra denominazione, ma giustificano completamente questa. Difatti oltre al minimo principale dell'Islanda a mm. 735, esistono due minimi importanti: l'uno a 744 sul cuore della Francia, l'altro a 749 sulle foci dell'Oder.

### 2. Periodi asciutti e periodi piovosi.

In questo mese si contano *diciassette giorni asciutti*: di questi però solo otto non ebbero precipitazione alcuna, negli altri nove invece caddero poche gocce in una o due località della regione. Dei rimanenti quattordici, in *otto giorni* le precipitazioni furono *limitate* a una parte della regione, in *sei* esse furono generali.

Le precipitazioni del 15, 18 e 26 furono quasi tutte e ovunque in forma di neve, furono invece ovunque allo stato liquido quelle del 31.

Il I. periodo, *pressochè asciutto*, iniziato il 26 del mese precedente, termina il 13 del mese corrente; giorni del tutto senza precipitazioni sono il 26, 27, 28 del mese scorso, il 5, 10, 11 e 13 del presente, negli altri giorni si ebbero precipitazioni sempre scarsissime e limitate a uno o due bacini al massimo; solo il 29 del mese scorso, il 3, il 9 e il 12 del presente queste ebbero una qualche estensione.

Al 14 il tempo cambia; si verifica il II. periodo, che è di 5 giorni a precipitazioni, le quali parziali, ossia limitate al bacino dell'Isonzo e alla parte piana della regione il 14, si estendono invece a tutta la regione nei quattro giorni successivi.

Il III. periodo va dal 19 al 24; esso è completamente *asciutto* nei primi quattro giorni; si è verificata qualche debole precipitazione nel bacino dell'Adige negli ultimi due: 23 e 24.

Al 25 si inizia il IV, ed ultimo periodo del mese, che è *piovoso*. Nevicate generali il 25; piogge generali e relativamente abbondanti il 31; tra gli altri giorni, nei quali le precipitazioni furono limitate specialmente alla parte occidentale della regione, si distingue il 29 perchè in esso caddero poche gocce solo nella bassa pianura occidentale.

### 3. La temperatura.

Giorni molto freddi furono dal 7 all'11; è stata un'ondata di freddo che, all'affermarsi delle alte pressioni nella Russia, s'è riversata da noi dalle fredde regioni nord orientali coi venti orientali.

La temperatura minima della regione in questi giorni venne raggiunta a Belluno con -9°4 il 7, -11°8 l'8, -8°3 il 9, -6°9 il 10 e -7°0 l'11.

Per tutto il resto del mese il freddo fu meno acuto che nel mese precedente, probabilmente in conseguenza del regime ciclonico, che spesso ha dominato. Alla stessa causa deve forse ascrivere il fatto che anche meno accentuate furono le inversioni termiche, come risulta dal confronto tra l'Osservatorio di Padova (fuori barriera S. Giovanni a 14 m. s. l. m.) e l'Osservatorio al Venda (577 m. s. l. m.),

dove, in entrambi, i termometri sono in capannine uguali, a m. 2.30 dal suolo. Da tale confronto risulta che l'andamento della temperatura fu normale, ossia temperatura più alta in basso, più bassa in alto in undici giorni ossia il 4, il 7, il 9, il 15, il 18, il 23, 25, 26, 27, 28 e il 31; negli altri giorni si verificarono inversioni. Il valore di queste inversioni, ossia la differenza di temperatura tra Venda e Padova raggiunse il valore massimo di 9°8 (a Padova -8°8, al Venda 6°0) il 1° del mese, 5°2 il 3, e 5°1 l'11, negli altri giorni tale valore si mantenne sempre sotto ai 5°, difatti tre volte fu compreso tra 5° e 3°, sette volte tra 3° e 1° e tre volte tra 1° e 0°.

### 4. Riassunto e conclusioni.

Il totale mensile delle precipitazioni in qualche luogo riuscì uguale (p. es. Valle dei Signori), in qualche altro riuscì leggermente superiore alla media del quinquennio 1911-15 (pubbl. 69 di quest'Uff.) come per es. a Padova 1,22 %, a Bassano 1,24 %, Rovigo, 1,42 % ecc. Il confronto è fatto solo per la precipitazione allo stato liquido; ma la neve, ad ogni modo, è stata scarsissima, cosicchè il mantello nevoso e le riserve idriche ne ricevettero deboli vantaggi.

In Europa il valore massimo raggiunto dalla pressione atmosferica in questo mese è di mm. 787 il giorno 23 sull'Estonia, e di 783 il giorno successivo sulla Scandinavia; i due valori più bassi sono 715 sull'Islanda l'8 e mm. 717 sul Golfo di Botnia il giorno 2.

La pressione nella nostra regione fu spesso sotto ai 760 mm. (a Venezia per sedici giorni), e oscillò tra un massimo di 772.6 il 1° a Trento, e un minimo di mm. 744.0 a Rovigo e Udine al 4.

Le relazioni tra i tipi isobarici e le precipitazioni nella regione si possono riassumere nelle seguenti tabelle:

GIORNI	TIPI ISOBARICI															
	I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII	XIII	XIV	XV	XVI
Con precipitazioni generali . . . . .	1	1	2	—	—	—	—	—	—	—	—	—	—	2	1	—
Con precipitazioni parziali . . . . .	3	—	1	—	—	—	—	—	—	—	—	—	—	1	—	—
Senza precipit. . . . .	2	—	2	1	1	3	2	1	—	—	—	—	—	2	1	4
Totale	6	1	5	1	1	3	2	1	3	1	3	1	2	1	4	4

Troviamo dunque che le piogge generali sulla regione, leggere, in questo mese, si verificarono insieme ad una depressione nel mediterraneo occidentale.

La pioggia generale, abbondante, del 31 si verificò invece con una larga depressione sull'Europa nord-occidentale, con un pendio piuttosto irregolare da Sud (l'alta pressione si trovava probabilmente nella Libia).

## Notizie sulle piene e sulle magre dei fiumi

I fiumi della Regione Veneta, già in fortissima magra dai mesi precedenti, continuano anche in gennaio a diminuire sensibilmente, raggiungendo la minima altezza alla metà del mese circa e rimanendo poi pressochè stazionari.

Particolarmente notevoli furono i valori eccezionalmente bassi di minima portata raggiunti nei principali fiumi della regione; il **Tagliamento** a Venzonè scese a m.<sup>s</sup> 13 circa al secondo, la **Piave** a Segusino a m.<sup>s</sup> 17, la **Brenta** a Sarson a m.<sup>s</sup> 14, l'**Adige** a Pescantina a m.<sup>s</sup> 50 ed il **Mincio** a Peschiera a m.<sup>s</sup> 16.

(È da notare che in questi valori non sono comprese le quantità d'acqua eventualmente derivate per uso industriale).

## Le magre del Tagliamento, della Brenta e dell'Adige durante il mese

Nella tabella seguente sono registrate le altezze idrometriche lette a Venzonè (Tagliamento), Sarson di Bassano (Brenta) e Pescantina (Adige).

Nella seconda tabella, allo scopo di porle a confronto con la magra in corso, vengono elencate le principali magre avvenute nei mesi di gennaio del decennio 1911-1920.

NB. — Come è noto la velocità che il vento imprime alle coppe della crociera dell'anemografo, velocità che è registrata nel diagramma, è inferiore alla velocità reale. Per passare dalla velocità registrata a quella reale, occorre perciò applicare un coefficiente maggiore dell'unità e che viene determinato in base a molte osservazioni di confronto con un anemografo campione. Il coefficiente non è costante, variando entro certi limiti colla velocità.

Coefficienti di riduzione dell'anemografo Steffens-Marini per Venezia: Per velocità orarie del vento fra 4 e 8 km. ora: coefficiente da applicare = 1,4; per velocità orarie del vento fra 8 e 12 km. ora: coefficiente da applicare = 1,3. Tali coefficienti devono applicarsi alle velocità indicate nella tabella, che sono quelle lette sui diagrammi, per ottenere la velocità reale.

Latitudine Nord: 45° 19'; Longitudine 0° 46' W da Roma.

Direzione e velocità oraria del vento; direzione, velocità e durata del vento prevalente; temperatura, umidità relativa e nebulosità media giornaliera

Altezza degli anemometri sul livello del mare m. 601; sul suolo m. 26 — Altezza della capanna termopsicrometrica sul livello del mare m. 577

## Avvertenze generali

Tutte le altezze e le escursioni di marea pubblicate nel bollettino (meno che per i mareografi di Viesti e Brindisi non ancora quotati) sono date in centimetri e sono riferite ad un piano ideale di base situato a m. 1,50 sotto il livello medio fondamentale del mare (si ottengono così nelle altezze di marea dei valori sempre positivi). I tempi sono calcolati sul tempo medio dell'Europa centrale. I dati di marea si riferiscono alle stazioni mareografiche di Pola, (entro il porto omonimo), di Trieste, di Diga Sud Lido (in mare aperto), Ancona (entro il porto omonimo), Viesti (in mare aperto) e Brindisi (all'imboccatura del porto).

I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

Le quote dei bulloni di riferimento per i mareografi dell'estuario veneto furono determinate in base alla livellazione, già ultimata, di un poligono che abbiamo chiamato fondamentale, appoggiato su capisaldi di partenza su roccia in posto, non soggetti perciò a fenomeni di costipamento o di assettamento del terreno. A tale poligono furono collegate le piastrelle dei principali mareografi in funzione nell'estuario veneto.

I dati dei mareografi di Pola e Trieste sono riferiti al livello medio locale determinato rispettivamente dall'ex Osservatorio marittimo di Trieste e dall'ex Istituto Idrografico della Marina austro-ungarica di Pola.

In tal modo possiamo dare le altezze di marea, non più misurate su un piano ideale di riferimento, ma riferite addirittura al livello medio del mare, che abbiamo assunto come fondamentale, in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

**Tabella I.** — La tabella prima dà i valori massimo e minimo raggiunti dal livello del mare nel mese, con le relative escursioni.

**Tabella II.** — La tabella seconda dà i massimi e minimi valori raggiunti dal livello medio diurno del mare nel mese e quindi le massime escursioni mensili del livello medio stesso.

**Tabella III.** — La tabella terza dà la massima ampiezza di marea osservata nel mese sia fra alta e bassa come fra bassa ed alta marea, consecutive.

**Tabella IV.** — La tabella quarta dà la minima escursione giornaliera del livello verificatasi nel mese.

**TABELLA I.**  
Massima escursione del livello nel mese

MAREOGRAFO	Livello massimo raggiunto			Livello minimo raggiunto			Escursione

## Ondulazioni secondarie

In questo mese si verificarono ondulazioni secondarie piuttosto forti nei giorni 4 e 31, leggere nei giorni 2, 3, 4, 11, 15 limitatamente all'Alto Adriatico, ed ondulazioni secondarie leggere limitatamente al Basso Adriatico nei giorni dall'1 al 17 e dal 26 al 31.

Venezia, marzo 1922

IL DIRETTORE  
GIOVANNI MAGRINI

## BOLLETTINO MENSILE - FEBBRAIO 1922

## INDICE

Diario delle condizioni meteorologiche ed idrografiche per le Venetie (esclusa la Giulia) . . . . . pag. 2

## ELEMENTI METEOROLOGICI OSSERVATI NELLE VENEZIE

ord. = ordine    aerol. = Stazione aerologica    princ. = Osservatorio principale

Osservatorio di:			Osservatorio di:		
Bassano (2° ord.)	pag.	10	Rovigo (1° ord.)	pag.	16
Belluno (2° ord.)	"	8	Trento (1° ord.)	"	13
Bolzano (1° ord.)	"	12	Trieste (1° ord.-aerol.)	"	4
Colle Veda (1° ord.)	"	21	Udine (1° ord.-aerol.)	"	6
Gorizia (2° ord.)	"	5	Venezia (princ.-aerol.)	"	14, 19, 20
Padova (1° ord.-aerol.)	"	15	Verona Bosco Mant. (1° ord.-aer.)	"	13
Pola (1° ord.)	"	4	Vicenza (1° ord.)	"	11

## ELEMENTI METEOROLOGICI ED IDROGRAFICI

## RELATIVI A CIASCUN BACINO FLUVIALE

Venezia Giulia	pag.	4	Bacino del Bacchiglione	pag.	11
Bacino dell'Isonzo	"	5	" dell'Agno Guà	"	11
" della Drava	"	6	" dell'alto Adige	"	12
" del Tagliamento	"	6	" del medio e basso Adige	"	13
" della Livenza	"	7	" del Po (Sarca e Mincio)	"	14
" della Piave	"	8	Alta pianura occidentale	"	14
Pianura orientale	"	9	Bassa pianura occidentale	"	15
Bacino della Brenta	"	10	Pianura polesana	"	16

## PLUVIOMETRIA E NIVOMETRIA

Precipitazioni giornaliere (vedi gli elementi idrografici per ciascun bacino).  
La situazione isobarica e le vicende atmosferiche con speciale riguardo alle precipitazioni . . . . . pag. 17

## SECCHENZA DEL TERRENO

(Vedi gli elementi idrografici per ciascun bacino).

## REGIME DEI CORSI D'ACQUA

Altezze giornaliere del livello ai principali idrometri dei corsi d'acqua (vedi gli elementi idrografici per ciascun bacino).  
Notizie sulle piene e sulle magre dei fiumi. — Le magre del Tagliamento, della Brenta e dell'Adige durante il mese — Confronti con le magre del Tagliamento, della Brenta e dell'Adige avvenute durante i mesi di febbraio del periodo 1911-20 . . . . . pag. 18  
Deflussi giornaliere e mensili, per il Boite a Perarolo, per la Brenta a Sarson, per l'Adige a Pescantina e Boara Pisani, per il Mincio a Peschiera . . . . . 3  
Materiale in sospensione nell'acqua dei fiumi (Tagliamento a Venzona, Piave a Belluno, Brenta a Stra, Adige a Pescantina) . . . . . 22  
Portata giornaliera del pozzo artesiano a Stra . . . . . 22  
Misure di portata eseguite nel mese . . . . . 22

## MAREOGRAFIA

Ore ed altezze delle alte e basse maree nel mese a Pola, Trieste e Diga Sud Lido (in mare aperto) . . . . . pag. 23  
Notizie sulle maree e fenomeni concomitanti . . . . . 24  
Ondulazioni secondarie . . . . . 24

## SEGNI CONVENZIONALI

(n), precipitazioni avvenute sotto forma di neve non misurata;  
m, la stazione manda soltanto il totale mensile delle precipitazioni;  
\*\*, lo strumento non ha funzionato;  
\*\*\*, strumento guasto;  
\*, non giunte le osservazioni - dato mancante o non calcolato;

?, dato incerto;  
(°), dato desunto dallo strumento a lettura diretta, invece che dal registratore;  
\*\*, dato interpolato o calcolato in base ad osservazioni interpolate;  
\*, pluviografo, idrometrografo;

+, pluviometro-nivometro: nei totali sono considerate anche le precipitazioni avvenute sotto forma di neve;  
°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione.

AVVERTENZE. — I valori massimi e minimi sono indicati col carattere grassetto per la parte meteorologica e ponendo i dati fra parentesi per la parte idrometrica.  
Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere ordinario sono sopra lo zero idrometrico; quelle stampate in carattere minuscolo sono sotto lo zero idrometrico.

Gli Osservatori considerati nel presente specchio sono i seguenti: Gorizia (Ginnasio Dante Alighieri), Udine (Castello), Belluno (Villa Ricci), Bassano (Ginnasio Comunale), Vicenza (Accademia Olimpica), Bolzano (Ginnasio superiore dei Francescani), Trento (R. Magistrato alle Acque), Bosco Mantico (Verona) (Cantieri aeronautici), Venezia (R. Magistrato alle Acque), Padova (R. Magistrato alle Acque), Rovigo (Seminario Vescovile).

La Venezia Giulia ha caratteristiche meteorologiche proprie molto diverse dalle due altre Venezie e non può essere considerata in un'unica tabella riassuntiva.

(1) Le temperature indicate si intendono non ridotte al livello del mare e rappresentano i valori massimo e minimo rispettivamente fra le temperature massima e minima osservate nei diversi Osservatori.

(2) Segni convenzionali: c = vento con direzione costante; i = vento con direzione variabile da osservatorio ad osservatorio; r = intera regione veneta; m = regione montana; p = pianura.

(3) La velocità del vento in questa colonna è espressa in gradi come segue: 0 grado = calma (inferiore a 1 km. all'ora); 1° grado = da 1 a 5 km. all'ora; 2° grado = da 5 a 10 km. all'ora; 3° grado = da 10 a 15 km. all'ora; ecc.

(4) Il numero che precede il tipo isobarico si riferisce alla classificazione che trovasi nell'8 relazione annuale del Direttore (pubbl. n. 84 dell'Ufficio).

(5) Quando occorre specificare in quale bacino sono avvenute precipitazioni, vengono generalmente usate le seguenti abbreviazioni: I. = Isonzo; T. = Tagliamento; L. = Livenza; P. = Piave; p. o. = pianura orientale; Br. = Brenta; Ba. = Bacchiglione; Ag. = Agno; A. A. = Alto Adige; M. A. = Medio Adige; p. occ. = pianura occidentale; p. pol. = pianura polesana. Gli altri fenomeni meteorologici vengono dati per osservatorio, usando generalmente le seguenti abbreviazioni: G. = Gorizia; Ud. = Udine; Bl. = Belluno; Bas. = Bassano; Vic. = Vicenza; Bz. = Bolzano; Trt. = Trento; B. M. = Bosco Mantico; Ven. = Venezia; P. = Padova; R. = Rovigo.

(6) Per indicare i corsi d'acqua, oltre alle abbreviazioni suesposte vengono adoperate anche le seguenti: S. = Sile; Fr. = Frassin; Go. = Gorzone; Ft. = Fratta; Pl. = Po di Levante. Per lo stato dei fiumi si adoperano i seguenti segni convenzionali: f. m. = forte magra; m. = magra; d. M. = debole morbida; M. = morbida; M. a. = morbida accentuata; p. = piena; f. p. = forte piena.

(7) Abbreviazioni: Pr. = Promontorio; Sc. = Saccatura; Sl. = Sella; Pd. = Fondio; Depr. = Depressione; AP. = Alta pressione; C. = Ciclone; CS. = Ciclone secondario; AC. = Anticiclone.

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Boite a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Mincio a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richiesto per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero; ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24<sup>h</sup>. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene dedotta mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbida media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Per avere l'effettivo contributo in litri per km.<sup>2</sup> deve essere però anche considerata la portata del canale di derivazione per l'irrigazione dell'alto Agro Veronese, che non è compresa nella portata misurata a Pescantina.

(2) Per ottenere l'effettivo contributo in litri per km.<sup>2</sup> deve essere considerata anche l'acqua derivata nell'Adigetto a Badia Polesine e le derivazioni minori. Le indicazioni per tenerne conto saranno pubblicate in uno dei prossimi bollettini.

NR. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Per variazione della pressione va intesa la differenza (in mm.) della pressione alle ore 0 e alle ore 24. Tale valore è accompagnato dalle seguenti abbreviazioni: a = aumento; d = diminuzione; r = regolare; i = irregolare; c = la pressione si mantiene quasi costante ed è soggetta alla sola variazione giornaliera.

(2) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Pola = +0°2; Osservatorio di Trieste = 0. Per ottenere la temperatura osservata, tali coefficienti vanno sottratti dal valore della temperatura media riportato nelle tabelle. Per esempio, la temperatura media vera del giorno 1 a Pola è di 7°6 — 0°2 = 7°4 che è quella dedotta dalle osservazioni.

(3) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

tab. A

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle " Precipitazioni meteoriche „ e quelli della parte inferiore alle " Osservazioni idrometriche „.

(11) **Abbreviazioni:** a = aumento; d = diminuzione; r = regolare; i = irregolare; o = la pressione si mantiene quasi costante ed è soggetta alla sola variazione giornaliera (Vedi pag. 4).

(2) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Rovigo = + 0,1 (Vedi esempio a pag. 4).

(3) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

## La situazione isobarica e le vicende atmosferiche con speciale riguardo alle precipitazioni.

### 1. Diario delle condizioni idrografiche e meteorologiche del mese (vedi pag. 2).

Il ciclone secondario che al mattino del 31 gennaio si trovava nel cuore della Francia, scende più a Sud; alla sera lo ritroviamo nel mar Mediterraneo e al mattino successivo sull'Italia centrale a mm. 747; persistono le piogge generali abbondanti nella nostra regione che cessano il giorno appresso, quando il ciclone si è allontanato rapidamente verso SE. Ma le piogge parziali ritornano al giorno 3, quando sul golfo di Genova si manifesta un ciclone secondario collegato, mediante saccatura che gira da levante il massiccio alpino, col Ciclone dell'Atlantico settentrionale.

Nel giorno appresso, 4, non si trova più il ciclone, ma una saccatura del tipo VII, che il giorno 5 dà luogo ad una saccatura del tipo VI. Con queste configurazioni cadono ancora poche gocce qua e là, ma in così scarsa quantità da sfuggire alla misura; si può quindi dire che dal 4 si è iniziato il periodo asciutto.

Al 5 le Alte Pressioni, che sino a quel giorno erano state divise in due nuclei, dei quali uno al Nord della Scandinavia, e l'altro sulle Azzorre, si riuniscono a formare una striscia lungo le coste Atlantiche, la quale, nei giorni successivi, lentamente si sposta parallelamente a sé stessa verso ESE, riunendosi anche alle Alte Pressioni Russe. E lungo questa striscia sull'Europa centrale si sposta il nucleo anticiclonico superando i 780 mm. nei giorni 10, 11 e 12. In seguito questo nucleo scende verso Sud, in Austria ed in Ungheria; il 15 è in Serbia, mandando un promontorio sulle Alpi.

È una serie di giorni sereni, ma freddi da noi, perchè intanto le aree cicloniche dell'Atlantico s'insinuano attraverso alla Spagna e allo Stretto di Gibilterra nel basso Mediterraneo, mentre l'Anticiclone delle Azzorre si è ritirato molto addietro nell'Atlantico. Si può pensare anche che l'Italia centrale e con essa tutta la regione mediterranea alla stessa latitudine fossero sulla fronte polare della corrente settentrionale che aveva portato forti freddi su tutta l'Europa.

In questo tempo si sono verificate le forti nevicate e i venti burrascosi dell'Italia centrale e meridionale che dall'8 al 9 portarono gravi danni alle comunicazioni ferroviarie, telefoniche e telegrafiche della nostra penisola e di quella balcanica.

Al costituirsi nel bacino occidentale di una vasta, per quanto debole, depressione (mm. 762) devono ascrivere le precipitazioni verificatesi il 15 nella parte occidentale della nostra regione (tipo XV), che continuano nel giorno successivo, mentre il Ciclone si trasporta nell'Italia meridionale (tipo XVII B). All'allontanarsi di questo Ciclone verso l'Egeo, e all'avanzare dell'Anticiclone delle Azzorre sin sulla Svizzera deve attribuirsi il breve rasserenamento del 17.

Al 18 però riprendono le piogge generali, quando, ritirandosi l'Anticiclone delle Azzorre, il Mediterraneo tutto, in dipendenza del Ciclone del Mare del Nord, passa in regime ciclonico con tre nuclei: uno a Gibilterra, uno sul Golfo di Genova e un terzo nel Mar di Levante. Nel dì appresso, 19, permane lo stesso tipo (IV) con un approfondimento del Ciclone di Genova e la scomparsa di quello di Gibilterra.

Al 20, giornata senza piogge, si è colmato il Ciclone di Genova, si sono avanzati i due Anticicloni: quello dello Spitzberg, e quello delle Azzorre. Nella nostra penisola la pressione cresce, e si può riconoscere un gradiente generale dal Nord; per altro non si tratta di una configurazione netta, decisa, ma essa, più che a qualsiasi altro tipo, assomiglia al XVIII.

Al 21 una vasta area di depressioni settentrionali manda una saccatura sin nel Mediterraneo, si delinea il tipo IV, esso è ancora meglio deciso il 22, che determina piogge generali in tutta la regione.

Col 23 ricomincia un periodo di bel tempo che dura sino alla fine del mese. Lo dobbiamo ascrivere alla striscia di Alta Pressione, attraverso cui si sono ricongiunti gli Anticicloni surricordati sull'Europa

centrale, striscia che poi lentamente scende sin sul Mediterraneo. Sull'Italia la pressione cresce (a Venezia in quest'ultimo periodo s'è mantenuta sempre sopra i 769 mm., tranne il 27 che scese a 767).

Al 27 e al 28 sull'Italia e regioni vicine la pressione è pressoché uniforme, tipo XIII l'abbiamo classificata. La posizione del centro ciclonico settentrionale e il gradiente da S, per quanto debole, fanno ricordare il tipo III, ma persiste il tempo bello, e lo dobbiamo certo all'elevato valore della pressione e alla lontananza del centro ciclonico.

### 2. Periodi asciutti e periodi piovosi.

In questo mese si contano 20 giorni asciutti: di questi solo quattordici furono completamente senza precipitazione alcuna; negli altri sei caddero poche gocce in qualche località della regione. Dei rimanenti otto, in due, a precipitazioni parziali, le precipitazioni mancarono in qualche bacino, negli altri sei, a precipitazioni generali, queste si verificarono in tutta la regione.

Ovunque, nelle regioni montuose, le precipitazioni furono in parte allo stato di neve.

I primi tre giorni del mese costituiscono la continuazione dell'ultimo periodo umido del mese scorso che risulta così di 8 giorni. Il primo le precipitazioni furono abbondanti, mancarono quasi del tutto il 2, e furono limitate e scarse il giorno 3.

Col giorno 4 s'inizia il II periodo del mese: periodo asciutto che dura 12 giorni, sino al 14 incluso.

Al 15 s'inizia il III periodo, umido con precipitazioni generali, ma non tanto abbondanti che dura 8 giorni, sino al 22, ma durante il quale il 17 e il 20 furono asciutti, il 21 con precipitazioni parziali.

Al 23 s'inizia il IV ed ultimo periodo del mese con giorni sempre sereni.

### 3. La temperatura.

Un periodo molto freddo si è verificato sulla regione a partire dal 6 fino al 15, in cui più volte il termometro nella regione qua e là (Belluno, Udine, Venda, Padova) scese sotto i - 9, con un minimo di - 11 il giorno 8 a Belluno. Il minimo di tutta la stagione si è verificato in gennaio, ma questo periodo di freddo richiama l'attenzione per la sua lunghezza — nove giorni consecutivi — e per essere sopraggiunto dopo alcuni giorni miti, nei quali la temperatura minima era scesa appena di qualche grado sotto zero.

Si tratta di una corrente fredda polare, che sin dal 4 s'era fatta sentire sull'Europa, producendovi un forte salto in basso del termometro (un salto di oltre 20° nella Germania meridionale); in ciò differisce dal periodo freddo verificatosi nella prima metà di gennaio, del quale la causa principale deve ascrivere al raffreddamento per irraggiamento del suolo. Difatti, mentre in gennaio le temperature più basse si sono verificate dapprima in basso, e poi in alto, stavolta avviene il contrario. Sul Venda, dal 6 sino all'8 compreso, vengono segnalate temperature più basse che a Padova; le cose cambiano a partire dal 9, quando la temperatura del suolo, ormai raffreddatosi per il lavaggio con aria fredda dei giorni precedenti, e che si raffredda ulteriormente per irraggiamento, continua a scendere, mentre in alto affluisce nuova aria più mite, la quale non riesce a scendere al suolo, dove stagna aria più fredda e quindi più densa. Ciò appare nettamente dalla seguente tabella che dà per i giorni in questione la temperatura al Venda e a Padova delle ore 8:

GIORNI	4	5	6	7	8	9	10	11	12	13	14	15
Venda . . .	1.6	-0.8	-5.6	-8.2	-9.4	-4.7	-5.2	-4.4	-5.2	-2.7	0.2	0.4
Padova . . .	2.2	1.0	-1.2	-3.4	-8.4	-7.8	-7.4	-2.8	-4.4	-4.4	-4.6	-3.2

Verso la fine del mese la temperatura andò rapidamente aumentando e salì sopra zero; quest'aumento fu più rapido e sensibile in alto, tanto da dar luogo a notevoli inversioni come risulta dall'unita tabella che dà la temperatura delle ore 8:

GIORNI	22	23	24	25	26	27	28
Venda . . . . .	2.0	4.4	7.2	10.1	8.6	8.4	7.8
Padova . . . . .	6.0	2.4	1.6	2.2	2.6	7.4	4.6

Numerose, anche in questo mese, furono le inversioni termiche nella pianura: difatti in diciassette giorni riscontriamo sul Venda una temperatura più elevata che non in basso a Padova. In due volte la differenza superò i 6°, con un massimo di 7°,9 il 25, per due volte la differenza è compresa tra 6° e 4°, per dieci tra 4° e 2°, e per tre volte tale differenza è inferiore ai 2°.

### 4. Riassunto e conclusioni.

Il totale mensile delle precipitazioni ovunque riuscì notevolmente inferiore alla media del quinquennio 1911-1915 (pubbl. 69 di quest'UFF.); esso difatti ha costituito di tale media il 16%, a Belluno, il 17 a Bassano, il 35 a Venezia, il 39 a Padova; Valli dei Signori col 51%, segna una delle percentuali più alte del mese.

La caduta di neve nella nostra regione è stata sempre e dovunque leggera; il mantello nevoso continua a mantenersi molto alto rispetto agli anni precedenti.

In Europa il valore massimo raggiunto dalla pressione atmosferica è di 783 a Danzica il 10, e in Polonia il 12; il valore minimo si è avuto nell'Islanda il 19 con mm. 714, a cui segue dappresso l'altro valore di 723 pure in Islanda il giorno successivo.

Nella nostra regione la pressione ha oscillato tra 746.4 a Vicenza il 1°, e 774.3 a Trento il 10.

Le relazioni tra i tipi isobarici e le precipitazioni nella regione si possono riassumere nella seguente tabella:

GIORNI	TIPI ISOBARICI												
	I	II	III	IV	V	VI	VII	VIII	IX	X	XI	XII	XIII
Con precipitazioni generali . . . . .	—	—	4	—	—	—	—	—	1	—	1	1	—
Con precipitazioni parziali . . . . .	—	—	1	—	—	—	—	—	—	—	—	—	—
Senza precipit. . . . .	1	2	—	1	1	3	1	2	—	4	—	—	5
Totale	1	2	5	1	1	3	1	2	1	4	1	1	5

Troviamo dunque che tutte le piogge in questo mese si verificarono insieme ad una depressione nel terzo quadrante (tra S ed W) rispetto alla regione.

## Notizie sulle piene e sulle magre dei fiumi

I fiumi della regione continuano, anche in questo mese, a mantenersi in fortissima magra, restando però quasi stazionari rispetto alle altezze minime raggiunte nel mese precedente. Soltanto nell'Adige e nel Mincio si nota un'ulteriore diminuzione che porta il livello di questi due fiumi rispettivamente a m. - 2.37 (a cui corrisponde una portata di m.<sup>3</sup> 47) all'idrometro di Pescantina il giorno 10, e a m. - 0.05 (a cui corrisponde la portata di m.<sup>3</sup> 15.5) all'idrometro di Peschiera il giorno 25. Tali valori sono anche i minimi dell'intero periodo di magra.

## Le magre del Tagliamento, della Brenta e dell'Adige durante il mese

Nella tabella seguente sono registrate le altezze idrometriche lette a Venzone (Tagliamento), Sarson di Bassano (Brenta) e Pescantina (Adige).

Nella seconda tabella vengono raccolti alcuni dati relativi alle principali magre avvenute, nello stesso mese di febbraio, nel decennio 1911-1920, allo scopo di metterle a confronto con la eccezionale magra attualmente in corso.

Coral d'acqua e Idrometri	Altezza della magra ordinaria	Ore	GIORNI																															Livello minimo

NB. — Come è noto la velocità che il vento imprime alle coppe della crociera dell'anemografo, velocità che è registrata nel diagramma, è inferiore alla velocità reale. Per passare dalla velocità registrata a quella reale, occorre perciò applicare un coefficiente maggiore dell'unità e che viene determinato in base a molte osservazioni di confronto con un anemografo campione. Il coefficiente non è costante, variando entro certi limiti colla velocità.

Coefficienti di riduzione dell'anemografo Steffens-Marini per Venezia: Per velocità orarie del vento fra 4 e 8 km. ora: coefficiente da applicare = 1,4; per velocità orarie del vento fra 8 e 12 km. ora: coefficiente da applicare = 1,3. Tali coefficienti devono applicarsi alle velocità indicate nella tabella, che sono quelle lette sui diagrammi, per ottenere la velocità reale.

Latitudine Nord: 45° 19'; Longitudine 0° 46' W da Roma

Direzione e velocità oraria del vento; direzione, velocità e durata del vento prevalente; temperatura, umidità relativa e nebulosità media giornaliera

Altezza degli anemometri sul livello del mare m. 601; sul suolo m. 26 — Altezza della capanna termopsicrometrica sul livello del mare m. 577

N.B. — I saggi d'acqua vengono raccolti nel filone della corrente; la torbidità viene determinata col metodo descritto nella 9<sup>a</sup> Relazione annuale del Direttore (1917) e indicata coi grammi di materie in sospensione contenuti in 1000 grammi d'acqua.

NB. — Vedi le avvertenze generali a pag. 24.

## Avvertenze generali

Tutte le altezze e le escursioni di marea pubblicate nel bollettino (meno che per i mareografi di Viesti e Brindisi non ancora quotati) sono date in centimetri e sono riferite ad un piano ideale di base situato a m. 1,50 sotto il livello medio fondamentale del mare (si ottengono così nelle altezze di marea dei valori sempre positivi). I tempi sono calcolati sul tempo medio dell'Europa centrale. I dati di marea si riferiscono alle stazioni mareografiche di Pola, (entro il porto omonimo), di Trieste, di Diga Sud Lido (in mare aperto), Ancona (entro il porto omonimo), Viesti (in mare aperto) e Brindisi (all'imboccatura del porto).

I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

Le quote dei bulloni di riferimento per i mareografi dell'estuario veneto furono determinate in base alla livellazione, già ultimata, di un poligono che abbiamo chiamato fondamentale, appoggiato su capisaldi di partenza su roccia in posto, non soggetti perciò a fenomeni di costipamento o di assettamento del terreno. A tale poligono furono collegate le piastrine dei principali mareografi in funzione nell'estuario veneto.

I dati dei mareografi di Pola e Trieste sono riferiti al livello medio locale determinato rispettivamente dall'ex Osservatorio marittimo di Trieste e dall'ex Istituto Idrografico della Marina austro-ungarica di Pola.

In tal modo possiamo dare le altezze di marea, non più misurate su un piano ideale di riferimento, ma riferite addirittura al livello medio del mare, che abbiamo assunto come fondamentale, in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

Tabella I. — La tabella prima dà i valori massimo e minimo raggiunti dal livello del mare nel mese, con le relative escursioni.

Tabella II. — La tabella seconda dà i massimi e minimi valori raggiunti dal livello medio diurno del mare nel mese e quindi le massime escursioni mensili del livello medio stesso.

Tabella III. — La tabella terza dà la massima ampiezza di marea osservata nel mese sia fra alta e bassa come fra bassa ed alta marea, consecutive.

Tabella IV. — La tabella quarta dà la minima escursione giornaliera del livello verificatasi nel mese.

TABELLA I.  
Massima escursione del livello nel mese

MAREOGRAFO	Livello massimo raggiunto			Livello minimo raggiunto			Escursione
	giorno	ora	altezza	giorno	ora	altezza

## Ondulazioni secondarie

In questo mese si verificarono forti ondulazioni secondarie a Pola il giorno 7, ad Ancona il giorno 7 ed 8 e a Brindisi il giorno 7; ondulazioni secondarie leggere nei giorni 1 e dal 4 al 10 generalmente estese a tutto l'Adriatico.

Venezia, aprile 1922

IL DIRETTORE  
GIOVANNI MAGRINI

## BOLLETTINO MENSILE - MARZO 1922

## INDICE

Diario delle condizioni meteorologiche ed idrografiche per le Venezie (esclusa la Giulia) . . . . . pag. 2

## ELEMENTI METEOROLOGICI OSSERVATI NELLE VENEZIE

## PLUVIOMETRIA E NIVOMETRIA

Precipitazioni giornaliere (vedi gli elementi idrografici per ciascun bacino).

La situazione isobarica e le vicende atmosferiche con speciale riguardo alle precipitazioni . . . . . pag. 17

## SECCHENZA DEL TERRENO

(Vedi gli elementi idrografici per ciascun bacino).

## REGIME DEI CORSI D'ACQUA

Altezze giornaliere del livello ai principali idrometri dei corsi d'acqua (vedi gli elementi idrografici per ciascun bacino).

Notizie sulle piene e sulle magre dei fiumi. — La piena della Livenza e del Frassine avvenuta dal 22 al 25 marzo - Confronti con le principali piene avvenute nella Livenza e nel Frassine durante i mesi di marzo del decennio 1911-20 . . . . . pag. 18

Deflussi giornalieri e mensili, per il Boite a Perarolo, per la Brenta a Sarson, per l'Adige a Pescantina e Boara Pisani, per il Mincio a Peschiera . . . . . 3

Materiale in sospensione nell'acqua dei fiumi (Tagliamento a Venzone, Piave a Belluno, Brenta a Stra, Adige a Pescantina) . . . . . 22

Portata giornaliera del pozzo artesiano a Stra . . . . . 22

Misure di portata eseguite nel mese . . . . . 22

## MAREOGRAFIA

Ore ed altezze delle alte e basse maree nel mese a Pola, Trieste e S. Nicolò di Lido (in mare aperto) . . . . . pag. 23

Notizie sulle maree e fenomeni concomitanti . . . . . 24

Ondulazioni secondarie . . . . . 24

## SEGNI CONVENZIONALI

(n), precipitazioni avvenute sotto forma di neve non misurata;  
m, la stazione manda soltanto il totale mensile delle precipitazioni;  
\*\*, lo strumento non ha funzionato;  
\*\*\*, strumento guasto;  
v, non giunte le osservazioni - dato mancante o non calcolato;

?, dato incerto;  
(°), dato desunto dallo strumento a lettura diretta, invece che dal registratore;  
\*\*, dato interpolato o calcolato in base ad osservazioni interpolate;  
\*, pluviografo, idrometrografo;

+, pluviometro: nei totali sono considerate anche le precipitazioni avvenute sotto forma di neve;  
°, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione.

AVVERTENZE. — I valori massimi e minimi sono indicati col carattere grassetto per la parte meteorologica e ponendo i dati fra parentesi per la parte idrometrica.  
Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere ordinario sono sopra lo zero idrometrico; quelle stampate in carattere minuscolo sono sotto lo zero idrometrico.

Gli Osservatori considerati nel presente specchio sono i seguenti: Gorizia (Ginnasio Dante Alighieri), Udine (Castello), Belluno (Villa Riedi), Bassano (Ginnasio Comunale), Vicenza (Accademia Olimpica), Bolzano (Ginnasio superiore dei Francescani), Trento (R. Magistrate alle Acque), Bosco Mantico (Verona) (Cantiero aeronautico), Venezia (R. Magistrate alle Acque), Padova (R. Magistrate alle Acque), Rovigo (Seminario vescovile).

La Venezia Giulia ha caratteristiche meteorologiche proprie molto diverse dalle due altre Venezia e non può essere considerata in un'unica tabella riassuntiva.

(1) Le temperature indicate si intendono non ridotte al livello del mare e rappresentano i valori massimo e minimo rispettivamente fra le temperature massima e minima osservate nei diversi Osservatori.

(2) Segni convenzionali: c = vento con direzione costante; i = vento con direzione variabile da osservatorio ad osservatorio; r = intera regione; v = vento; m = regione montana; p = pianura.

(3) La velocità del vento in questa colonna è espressa in gradi come segue: 0 grado = calma (inferiore a 1 km. all'ora); 1° grado = da 1 a 5 km. all'ora; 2° grado = da 5 a 10 km. all'ora; 3° grado = da 10 a 15 km. all'ora; ecc.

(4) Il numero che precede il tipo isobarico si riferisce alla classificazione che trovasi nell'8 relazione annuale del Direttore (pubbl. n. 84 dell'Ufficio).

(5) Quando occorre specificare in quale bacino sono avvenute precipitazioni, vengono generalmente usate le seguenti abbreviazioni: l. = Isoso; T. = Tagliamento; L. = Livenza; P. = Piave; p. o. = pianura orientale; Br. = Brenta; Ba. = Bacchiglione; Ag. = Agno; A. A. = Alto Adige; M. A. = Medio Adige; p. occ. = pianura occidentale; p. pol. = pianura polesana. Gli altri fenomeni meteorologici vengono dati per osservatorio, usando generalmente le seguenti abbreviazioni: G. = Gorizia; Ud. = Udine; Bl. = Belluno; Bas. = Bassano; Vic. = Vicenza; Bz. = Bolzano; Trt. = Trento; B. M. = Bosco Mantico; Ven. = Venezia; P. = Padova; R. = Rovigo.

(6) Per indicare i corsi d'acqua, oltre alle abbreviazioni suesposte vengono adoperate anche le seguenti: S. = Sile; Fr. = Frassinone; Go. = Gorzone; Fl. = Fratta; Pl. = Po di Levante. Per lo stato dei fiumi si adoperano i seguenti segni convenzionali: f. m. = forte magra; m. = magra; d. M. = debole morbida; M. = morbida; M. a. = morbida accentuata; p. = piena; f. p. = forte piena.

(7) Abbreviazioni: Pr. = Promontorio; Sc. = Saccatura; Sl. = Sella; Pd. = Pendio; Depr. = Depressione; AP. = Alta pressione; C. = Ciclone; CS. = Ciclone secondario; AC. = Anticiclone; PL. = Pressione livellata.

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Bolte a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Mincio a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richiesto per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero, ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24 ore. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene dedotta mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbida media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Per avere l'effettivo contributo in litri per km.<sup>2</sup> deve essere però anche considerata la portata del canale di derivazione per l'irrigazione dell'alto Agro Veronese, che non è compresa nella portata misurata a Pescantina.

(2) Per ottenere l'effettivo contributo in litri per km.<sup>2</sup> deve essere considerata anche l'acqua derivata nell'Adigetto a Badia Polesine e le derivazioni minori. Le indicazioni per tenerne conto saranno pubblicate in uno dei prossimi bollettini.

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Per variazione della pressione va intesa la differenza (in mm.) della pressione alle ore 0 e alle ore 24. Tale valore è accompagnato dalle seguenti abbreviazioni: a = aumento; d = diminuzione; r = regolare; i = irregolare; c = la pressione si mantiene quasi costante ed è soggetta alla sola variazione giornaliera.

(2) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Pola = + 0°2; Osservatorio di Trieste = 0. Per ottenere la temperatura osservata, tali coefficienti vanno sottratti dal valore della temperatura media riportato nelle tabelle. Per esempio, la temperatura media vera del giorno 1 a Pola è di 11°4 - 0°2 = 11°2 che è quella dedotta dalle osservazioni.

(3) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Bassano = + 0°9. (Vedi esempio a pag. 4).

(2) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

(1) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Vicenza = + 0°,4 (Vedi esempio a pag. 4).

(2) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

(3) Le osservazioni vennero eseguite alle ore 9.

(3) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.: ecc.

## 1. Diario delle condizioni idrografiche e meteorologiche del mese (vedi pag. 2).

L'estremità meridionale della saccatura da NNW che all'uno si trovava nella parte più occidentale del Mediterraneo, dipendenza del Ciclone dell'Europa Nord occidentale (Mar del Nord 732), si sposta verso levante, e al 2 dà luogo al Tipo V, con un ciclone secondario sul Golfo di Genova, collegato col ciclone principale con isobare che attraversano le Alpi orientali; ciò porta una giornata di piogge generali nella nostra regione.

Al 3 ritorna il sereno; lo dobbiamo al rapido spostarsi verso SE del ciclone segnalato sul Golfo di Genova; esso dalla sua nuova posizione (Grecia il 3), unitamente al nucleo anticiclonico formatosi sulle Alpi in dipendenza dell'Anticiclone principale delle Azzorre, concorre a provocare venti settentrionali. E il tempo asciutto continua anche nei giorni successivi, quando la pressione, dopo avere raggiunto un massimo di 772.3 a Venezia il 4, decresce lentamente sino al 7 (763.6); in questo periodo siamo in regime anticiclonico: le Alte Pressioni segnalate sulle Alpi progressivamente vanno estendendosi verso l'Africa.

Al 7 un forte Ciclone sull'Islanda manda un'ampia saccatura sul Mediterraneo occidentale. In tutta la nostra regione spirano venti deboli in pianura, che danno luogo a venti di scirocco a pochi metri dal suolo, e poi in alto, mantenendosi sempre del III quadrante sino a 2000 metri, ruotano verso Ovest; qua e là cadono deboli piogge. Le piogge e le nevicite si fanno copiose e generali all'affacciarsi di una depressione sull'Europa occidentale e centrale, e al diminuire della pressione da noi. Difatti a Venezia nei giorni

	6	7	8	9	10	11	12
la pressione è	68.6	68.6	58.6	60.2	59.3	67.2	70.8

Al 8 si tratta di un Tipo III non netto, poichè sulle Alpi e nella Val Padana le isobare presentano le solite deviazioni con una leggera saccatura da Est; a questa probabilmente si devono attribuire i venti settentrionali al suolo, ai quali succedono più in alto venti occidentali. Il Tipo III si delinea meglio nei giorni successivi 9 e 10: al 9 il centro ciclonico è sul Baltico, alle foci dell'Oder; al 10 su tutta l'Europa continentale si stende una vasta area ciclonica con diversi nuclei a mm. 755; uno sul Golfo di Guascogna, un altro sulla Manica, un terzo sul Mare del Nord e un quarto sulla Boemia.

La situazione isobarica muta rapidamente dal 10 all'11; un anticiclone a 774 ad W dell'Islanda manda un promontorio che va a toccare altro promontorio che avanza dalla penisola Balcanica; la pressione cresce rapidamente da noi; ma persistono le piogge per la presenza di una notevole depressione nel Mediterraneo occidentale (759 Algeria).

Dal 12 al 19, compreso, si susseguono una serie di giorni asciutti: le Alte pressioni già segnalate sull'Islanda si avanzano verso levante. Altre da Est si avanzano sino ad interessare tutta l'Italia, sulla quale il 12, 13, 14, 15 si stende un notevole pendio da Est. Questo pendio nei giorni successivi cambia direzione, e ruota sino a divenire da Nord. Le depressioni dal Golfo di Guascogna intanto scendendo nel basso Mediterraneo si spostano verso Levante, mentre nella nostra regione le correnti settentrionali tengono lontane le precipitazioni. E con l'azione pure di questi venti che dominano nella regione veneta sembrami si possa spiegare se la striscia di bassa pressione che al 15 dal Golfo di Guascogna si stendeva attraverso l'Italia settentrionale e l'Ungheria sino alla Russia con ciclone secondario sulle coste Tirreniche ed altro in Ungheria ha portato pioggia solo sull'Italia centrale.

Al 19 s'inizia la modificazione della situazione generale: delle Alte pressioni avanzano da levante e da mezzogiorno ed i cicloni sono costretti a lasciare il cammino del Mediterraneo; al 20 infatti s'inizia una serie di giorni piovosi, quando su tutta l'Europa si stende una vasta area ciclonica con nuclei diversi (Spagna, Francia, Germania, Danimarca).

Al 21 un notevole ciclone torna ad interessare il Mediterraneo e movendo dallo stretto di Gibilterra (21), per le bocche di Bonifacio (22), per la pianura Padana (23 e 24), passa a levante, mentre il vento tra S e SE che avea spirato con continuità nei giorni 20, 21 e 22, allo spostarsi del nucleo ciclonico ruota a ponente.

Il ciclone secondario a mm. 748 manifestatosi sul Golfo di Genova il 24 sera, come contraccollo del principale a 745 sull'Islanda, passa al mattino del 25 in Val Padana, dove si colma, mentre il principale avanza verso SE, e il mattino del 27, alquanto colmato, si estende su tutta l'Europa continentale con nucleo a 742 sulla Boemia. E sotto l'azione di questi cicloni ininterrottamente succedentisi sulla nostra regione cadono continue piogge generali e nevicite, le quali si riducono solo a poche località il 28, il 29 e il 30, quando il ciclone principale spostatosi a levante e trovandosi l'Europa tutta su un pendio da W, sulle Alpi si protende un promontorio da W, accompagnato da saccatura da Est sull'Italia settentrionale. Le piogge riprendono generali il 31, quando sull'Europa occidentale è approdato un vasto ciclone e sull'Italia si stende un pendio da Sud (tipo III).

La configurazione isobarica del 15 è stata ascrivita al Tipo XV, col quale ha molte analogie, ma si differenzia per il fatto che il ciclone del Mediterraneo sembra essere secondario. Si dovettero metter a sè le configurazioni del 23 e 24, in cui l'azione principale è dovuta al ciclone in Val Padana, e che non è contemplato nella classificazione adottata.

## 2. Periodi asciutti e periodi piovosi.

In questo mese si contano 13 giorni asciutti e 18 giorni piovosi. Dei giorni piovosi quattro sono a precipitazioni parziali; gli altri 14 a precipitazioni generali, ossia a precipitazioni estese a tutta la regione.

Esclusa la pianura occidentale, la pianura Polesana e la Venezia Giulia in tutti gli altri bacini le precipitazioni furono accompagnate da nevi.

Sino al 6 del mese (compreso), continua il periodo asciutto, iniziatosi il 23 del mese precedente (dodici giorni in tutto), e interrotto da un giorno (il 2) a precipitazioni generali e relativamente abbondanti.

Al 7 con un giorno a precipitazioni parziali, seguito da altri, tutti a precipitazioni generali, s'inizia un periodo umido; esso dura fino all'11.

Dal 12 al 19, otto giorni senza precipitazione alcuna è un periodo asciutto.

Al 20 s'inizia, e va fino alla fine del mese, un periodo umido; si tratta di una serie di giorni a precipitazioni generali, tranne dal 27 al 30 in cui si succedettero quattro giorni a precipitazioni parziali.

## 3. Fenomeni notevoli.

LA TEMPERATURA. La temperatura che in pianura s'era mantenuta bassa verso la fine del mese scorso, al 28 cresce, ma poi diminuisce nuovamente tanto in alto come in basso, tanto che alle ore 8 del 3 ritroviamo 4.1 sul Venda e 0.8 a Padova. Cambiando vento, ossia ai venti settentrionali subentrando i meridionali, la temperatura per qualche giorno cresce maggiormente in alto, cosicchè si accentua il noto fenomeno dell'inversione termica nelle ore notturne e nelle prime ore del mattino.

Nell'ultimo periodo di maltempo, dal 21, la temperatura diminuisce e il mese si chiude con una temperatura bassa, e come sempre con la pioggia la temperatura è più bassa in alto che in pianura. Nei giorni ultimi del mese, a partire dal 27, la minima diurna si mantenne verso i 4 e 5° lungo le coste, ma toccò zero quasi ogni giorno nell'interno. Lo zero era stato segnato dal termometro a minima il 2 e il 3 a Belluno, e il 3 a Padova.

L'inversione termica verticale più forte del mese (alle ore 8 del mattino) si verificò il 4, e fu di 6° 8 (e precisamente il termometro segnò 0° 8 a Padova e 7° 2 al Venda); una volta l'inversione fu di 5.5, una di 4.2, una di 2.3 e le altre 6 volte si mantenne tra 2 e 1; in tutto si ebbero 10 inversioni.

L'ALTA MAREA ECCEZIONALE. Il 22 si verificò su tutto l'Alto Adriatico una marea di altezza eccezionale; essa superò di m. 0.95 la marea astronomica prevista per il Bacino di S. Marco. Lo sciroccale che nel basso Adriatico (a Viesti) era stato segnalato sin dal mattino del 19, e che nel giorno successivo con maggiore violenza s'era manifestato su tutto l'Adriatico, persistette e raggiunse violenza anche maggiore il 21 e 22, quando, al ciclone della Spagna del 19, subentrò, il 20, un ciclone che andò successivamente scavandosi e accostandosi alla nostra regione. L'azione

continuata della corrente sciroccale che incanalava l'acqua verso l'alto Adriatico e ne ostacolava l'uscita, unita alla forte differenza di pressione tra i due estremi dell'Adriatico (alle ore 18 del 22 erano 741 mm. a Venezia, e 753 a Viesti: una differenza di 10 mm. di mercurio, pari a 13.8 cm. d'acqua circa) hanno trattenuto l'acqua nell'alto Adriatico e raggiunse il massimo il 22 sera; in seguito, per il passaggio del ciclone in Val Padana la direzione del vento ruotò verso SW, e quindi le acque dell'Adriatico sono libere nel loro deflusso.

## 4. Riassunto e conclusioni.

Questo mese si stacca dai precedenti per la quantità notevole di precipitazioni in esso verificatesi: il totale mensile delle precipitazioni riuscì dappertutto superiore alla media del quinquennio 1911-15 (pubb. 69 di quest'Ufficio): tale totale infatti superò il 200% nel bacino della Livenza (Claut 300%), in quello della Piave (270% a Belluno), in quello dell'Agno (243% a Maltaure) e in quello dell'Isonzo (230% a Vedronza); inoltre superò il 150% negli altri bacini montani, e in fine in generale superò il 100% in pianura.

Come quantità assolute massime vanno ricordati i mm. 759 caduti in tutto il mese a Staroselo (bacino dell'Isonzo); 728 a Resia e 720 a Chievolis (Livenza).

Anche forti furono le nevicite, specie dal 19 al 26, nel bacino dell'Adige; il mantello di neve segnò uno spessore massimo di m. 2.65 a Schneeberg sul Passer.

Non molto accentuata è stata l'ampiezza dell'oscillazione della pressione atmosferica in questo mese in Europa: difatti il valore massimo da essa raggiunto è di mm. 778 sulla Spagna il 2, il valore minimo è mm. 731 l'8 sul mezzogiorno delle Isole Britanniche.

Nella regione veneta la pressione che s'era mantenuta sempre notevolmente sopra al 760 sino al 19 con un massimo di 772.3 a Udine e Trento il 4, scende sotto a 760 il 20 e vi resta sino alla fine del mese con un minimo di 743.6 a Rovigo il 26.

Le relazioni tra i tipi isobarici e le precipitazioni nella regione si possono riassumere nella seguente tabella:

GIORNI	TIPI ISOBARICI											*
	I	II	III	IV	V	VI	VII	VIII	IX	X	XI	
Con precipitazioni generali	—	—	6	2	1	—	—	—	3	—	—	2
Con precipitazioni parziali	—	—	—	1	2	1	—	—	—	—	—	—
Senza precipit.	1	3	—	—	—	—	3	1	1	1	1	2
Totale	1	3	6	3	3	1	3	1	4	1	1	2

(\*) Ciclone in Val Padana.

Troviamo dunque che le piogge generali sulla regione veneta, in questo mese di marzo, si verificano con una delle tre situazioni seguenti:

con centro ciclonico al nord d'Italia, mentre sulla penisola si stende un pendio da Sud, oppure mentre sul Tirreno esiste un ciclone secondario,

inoltre con alte pressioni a NW o a Nord d'Italia e una depressione nel Mediterraneo occidentale,

infine con ciclone in Val Padana.

In tutti i fiumi della regione riscontriamo, in questo mese, due notevoli aumenti di livello, verificatisi in relazione alle piogge dei giorni 9 e 10, e alle piogge veramente notevoli, specie nella regione orientale, dei giorni 20, 21, 22 e 23; termina quindi, alla fine della prima decade, l'eccezionale periodo di magra iniziato nell'anno scorso.

L'isonzo, il Tagliamento, la Livenza e la Brenta, in forte magra dal mese precedente, salirono nei giorni 10 ed 11 e vi si mantennero, decrescendo lentamente, fino al 21; in questo giorno e nel giorno seguente un forte aumento di livello li portò ben presto in piena che, durata in generale dal 22 al 25, raggiunse le altezze massime di m. 1.50, il 22, a Venzone (Tagliamento), m. 5.41, il 23, a S. Cassiano (Livenza) e m. 1.45, il 23, a Bassano (Brenta). I fiumi decrebbero quindi fino al 31, ritornando allo stato di morbida.

La Piave restò in magra fino al 9; in questo giorno salì in morbida e vi si mantenne fino al 31. Anche in questo fiume notiamo un sensibile incremento nei giorni 22 e 23; il livello massimo raggiunto fu di m. 2.18, il 23, a Belluno.

4 Nel Bacchiglione e nel Frassine la magra durò dal giorno 1 al 22, non avendo avuto che una leggerissima influenza le piogge cadute dall'8 all'11, mentre un forte aumento s'ebbe invece nel pomeriggio del 22; in poche ore questi due fiumi passarono in piena, raggiungendo, all'ora 1 del 23, le massime altezze di m. 2.68 a Borgo Berga (Bacchiglione) e m. 1.85 a Borgo Frassine (Frassine). Essi decrebbero quindi rapidamente, ritornando in magra negli ultimi tre giorni del mese.

L'Adige nel suo corso medio ed inferiore, in forte magra e stazionario nella prima decade, subì un leggero incremento dall'11 al 12, decrescendo poi lentamente fino al 22; da questo giorno un graduale aumento di livello, resosi più accentuato il 23 e 24, lo portò in leggera morbida (l'altezza massima raggiunta fu di metri 1.38 sotto lo zero idrometrico di Pescantina, e di m. 1.23 sotto lo zero idrometrico di Boara Pisani). Il fiume ritornò quindi in magra dal 26 al 31.

**La piena della Livenza e del Frassine avvenuta dal 22 al 25 marzo**

Allo scopo di illustrare particolarmente le piene avvenute nei due fiumi suddetti vengono pubblicate le due seguenti tabelle; la prima contiene le altezze orarie del livello registrate durante la piena agli idrometri di S. Cassiano e Motta per la Livenza, di Borgo Frassine e Brancaglia per il Frassine; la seconda contiene gli incrementi e decrementi orari, medi e massimi desunti dalle altezze di piena, ed il livello massimo raggiunto a ciascun idrometro.

## Osservatorio meteorologico di Venezia (R. Magistrato alle Acque)

Direzione e velocità (km. ora) del vento; direzione, velocità e durata del vento prevalente (il segno — indica calma di vento)

Altezza degli anemometri sul livello del mare m. 31; sul suolo m. 30

Giorno	h h																								Media giornaliera km. ora	Vento prevalente			Umidità relativa in %	Nebulosità relativa in dec.

NB. — Come è noto la velocità che il vento imprime alle coppe della crociera dell'anemografo, velocità che è registrata nel diagramma, è inferiore alla velocità reale. Per passare dalla velocità registrata a quella reale, occorre perciò applicare un coefficiente maggiore dell'unità e che viene determinato in base a molte osservazioni di confronto con un anemografo campione. Il coefficiente non è costante, variando entro certi limiti colla velocità.

Coefficienti di riduzione dell'anemografo Steffens-Marini per Venezia: Per velocità orarie del vento fra 4 e 8 km. ora: coefficiente da applicare = 1,4; per velocità orarie del vento fra 8 e 12 km. ora: coefficiente da applicare = 1,3. Tali coefficienti devono applicarsi alle velocità indicate nella tabella, che sono quelle lette sui diagrammi, per ottenere la velocità reale.

Latitudine Nord: 45° 19'; Longitudine 0° 46' W. da Roma

Direzione e velocità oraria del vento; direzione, velocità e durata del vento prevalente; temperatura, umidità relativa e nebulosità media giornaliera

Altezza degli anemometri sul livello del mare m. 601; sul suolo m. 26 — Altezza della capanna termopsicrometrica sul livello del mare m. 577

N.B. — I saggi d'acqua vengono raccolti nel filone della corrente; la torbidità viene determinata col metodo descritto nella 9ª Relazione annuale del Direttore (1917) e indicata coi grammi di materie in sospensione contenuti in 1000 grammi d'acqua.

NB. — Vedi le avvertenze generali a pag. 24.

## Avvertenze generali

Tutte le altezze e le escursioni di marea pubblicate nel bollettino sono date in centimetri e sono riferite ad un piano ideale di base situato a m. 1,50 sotto il livello medio fondamentale del mare (si ottengono così nelle altezze di marea dei valori sempre positivi). I tempi sono calcolati sul tempo medio dell'Europa centrale. I dati di marea si riferiscono alle stazioni mareografiche di Pola, (entro il porto omonimo), di Trieste, (in mare aperto), di S. Nicolò di Lido (entro il porto di Lido).

I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

Le quote dei bulloni di riferimento per i mareografi dell'estuario veneto furono determinate in base alla livellazione, già ultimata, di un poligono che abbiamo chiamato fondamentale, appoggiato su capisaldi di partenza su roccia in posto, non soggetti perciò a fenomeni di costipamento o di assettamento del terreno. A tale poligono furono collegate le piastrine dei principali mareografi in funzione nell'estuario veneto.

I dati dei mareografi di Pola e Trieste sono riferiti al livello medio locale determinato ri-

spettivamente dall'ex Osservatorio marittimo di Trieste e dall'ex Istituto Idrografico della Marina austro-ungarica di Pola.

In tal modo possiamo dare le altezze di marea, non più misurate su un piano ideale di riferimento, ma riferite addirittura al livello medio del mare, che abbiamo assunto come fondamentale, in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

Tabella I. — La tabella prima dà i valori massimo e minimo raggiunti dal livello del mare nel mese, con le relative escursioni.

Tabella II. — La tabella seconda dà i massimi e minimi valori raggiunti dal livello medio diurno del mare nel mese e quindi le massime escursioni mensili del livello medio stesso.

Tabella III. — La tabella terza dà la massima ampiezza di marea osservata nel mese sia fra alta e bassa come fra bassa ed alta marea, consecutive.

Tabella IV. — La tabella quarta dà la minima escursione giornaliera del livello verificatasi nel mese.

TABELLA I.  
Massima escursione del livello nel mese

MAREOGRAFO	Livello massimo raggiunto			Livello minimo raggiunto			Escursione

## Ondulazioni secondarie

In questo mese si verificarono ondulazioni secondarie forti nei giorni 22 e 23 generalmente estese a tutto l'alto Adriatico, ed ondulazioni secondarie leggere nei giorni 2, 20, 24, 26 a Trieste, nei giorni 2, 20, 21, 24, 26, 27 a Pola, e nei giorni 3, 6, 24 a S. Nicolò di Lido.

Venezia, maggio 1922

IL DIRETTORE  
GIOVANNI MAGRINI

## PLUVIOMETRIA E NIVOMETRIA

Precipitazioni giornaliere (vedi gli elementi idrografici per ciascun bacino).

La situazione isobarica e le vicende atmosferiche con speciale riguardo alle precipitazioni . . . . . pag. 17

## SECCHIEZZA DEL TERRENO

(Vedi gli elementi idrografici per ciascun bacino).

## REGIME DEI CORSI D'ACQUA

Altezze giornaliere del livello ai principali idrometri dei corsi d'acqua (vedi gli elementi idrografici per ciascun bacino).

Notizie sulle piene e sulle magre dei fiumi. — Le piene del Tagliamento dal 28 al 1 maggio - Confronti con le principali piene avvenute nel Tagliamento durante i mesi di aprile del decennio 1911-20. . . . . pag. 18

Deflussi giornalieri e mensili, per il Boite a Perarolo, per la Brenta a Sarson, per l'Adige a Pescantina e Boara Pisani, per il Mincio a Peschiera. . . . . 3

Materiale in sospensione nell'acqua dei fiumi (Tagliamento a Venzona, Piave a Belluno, Brenta a Stra, Adige a Pescantina) . . . . . 22

Portata giornaliera del pozzo artesiano a Stra . . . . . 22

Misure di portata eseguite nel mese . . . . . 22

## MAREOGRAFIA

Ore ed altezze delle alte e basse maree nel mese a Pola, Trieste e S. Nicolò di Lido (in mare aperto) . . . . . pag. 23

Notizie sulle maree e fenomeni concomitanti . . . . . 24

Ondulazioni secondarie . . . . . 24

## SEGNI CONVENZIONALI

(n), precipitazioni avvenute sotto forma di neve non misurata;  
m, la stazione manda soltanto il totale mensile delle precipitazioni;  
\*\*, lo strumento non ha funzionato;  
\*\*\*, strumento guasto;  
\*, non giunte le osservazioni - dato mancante o non calcolato;

?, dato incerto;  
(\*), dato desunto dallo strumento a lettura diretta, invece che dal registratore;  
\*\*, dato interpolato o calcolato in base ad osservazioni interpolate;  
\*, pluviografo, idrometrografo;

+, pluvio-nivometro: nei totali sono considerate anche le precipitazioni avvenute sotto forma di neve;  
\*, idrometro o idrometrografo posto in località ov'è sentito l'infusso della marea o dell'apertura o chiusura dei sostegni di navigazione.

AVVERTENZE. — I valori massimi e minimi sono indicati col carattere grassetto per la parte meteorologica e ponendo i dati fra parentesi per la parte idrometrica. Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere ordinario sono sopra lo zero idrometrico; quelle stampate in carattere minuscolo sono sotto lo zero idrometrico.

## Diario delle condizioni meteorologiche e idrografiche per le Venezie (esclusa la Giulia)

Gli Osservatori considerati nel presente specchio sono i seguenti: Gorizia (Ginnasio Dante Alighieri), Udine (Castello), Belluno (Villa Ricci), Bassano (Ginnasio Comunale), Vicenza (Accademia Olimpica), Bolzano (Ginnasio Superiore dei Francescani), Trento (R. Magistrato alle Acque), Bosco Mantico (Verona) (Cantieri aeronautici), Treviso (Seminario Vescovile), Venezia (R. Magistrato alle Acque), Padova (R. Magistrato alle Acque), Rovigo (Seminario Vescovile).

La Venezia Giulia ha caratteristiche meteorologiche proprie molto diverse dalle due altre Venezie e non può essere considerata in un'unica tabella riassuntiva.

(1) Le temperature indicate si intendono non ridotte al livello del mare e rappresentano i valori massimo e minimo rispettivamente fra le temperature massima e minima osservate nei diversi Osservatori.

(2) Segni convenzionali: c = vento con direzione costante; i = vento con direzione variabile da osservatorio ad osservatorio; r = intera regione veneta; m = regione montana; p = pianura.

(3) La velocità del vento in questa colonna è espressa in gradi come segue: 0 grado = calma (inferiore a 1 km. all'ora); 1° grado = da 1 a 5 km. all'ora; 2° grado = da 5 a 10 km. all'ora; 3° grado = da 10 a 15 km. all'ora; ecc.

(4) Il numero che precede il tipo isobarico si riferisce alla classificazione che trovasi nell'8 relazione annuale del Direttore (pubbl. n. 84 dell'Ufficio).

(5) Quando occorre specificare in quale bacino sono avvenute precipitazioni, vengono generalmente usate le seguenti abbreviazioni: I. = Isoneo; T. = Tagliamento; L. = Livenza; P. = Piave; p. o. = pianura orientale; Br. = Brenta; Ba. = Bacchiglione; Ag. = Agno; A. A. = Alto Adige; M. A. = Medio Adige; p. occ. = pianura occidentale; p. pol. = pianura polesana. Gli altri fenomeni meteorologici vengono dati per osservatorio, usando generalmente le seguenti abbreviazioni: G. = Gorizia; Ud. = Udine; Bl. = Belluno; Bas. = Bassano; Vic. = Vicenza; Bz. = Bolzano; Trt. = Trento; R. M. = Bosco Mantico; Ven. = Venezia; P. = Padova; R. = Rovigo.

(6) Per indicare i corsi d'acqua, oltre alle abbreviazioni suesposte vengono adoperate anche le seguenti: S. = Sile; Fr. = Frassin; Go. = Gorzone; Fl. = Fratta; Pl. = Po di Levante. Per lo stato dei fiumi si adoperano i seguenti segni convenzionali: f. m. = forte magra; m. = magra; d. M. = debolmente morbida; M. = morbida; M. a. = morbida accentuata; p. = piena; f. p. = forte piena.

(7) Abbreviazioni: Pr. = Promontorio; Sc. = Saccatura; SI. = Sella; Pd. = Pendio; Depr. = Depressione; AP. = Alta pressione; C. = Ciclone; CS. = Ciclone secondario; AC. = Anticiclone; FL. = Pressione livellata.

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Boite a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Mincio a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richiesto per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero, ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24 ore. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene dedotta mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbidità media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Per avere l'effettivo contributo in litri per km.<sup>2</sup> deve esserè però anche considerata la portata del canale di derivazione per l'irrigazione dell'alto Agro Veronese, che non è compresa nella portata misurata a Pescantina.

(2) Per ottenere l'effettivo contributo in litri per km.<sup>2</sup> deve essere considerata anche l'acqua derivata nell'Adigetto a Badia Polesine e le derivazioni minori. Le indicazioni per tenerne conto saranno pubblicate in uno dei prossimi bollettini.

--	---	---	---	---	---	---

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Per variazione della pressione va intesa la differenza (in mm.) della pressione alle ore 0 e alle ore 24. Tale valore è accompagnato dalle seguenti abbreviazioni: a = aumento; d = diminuzione; r = regolare; i = irregolare; c = la pressione si mantiene quasi costante ed è soggetta alla sola variazione giornaliera.

(2) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Pola = +0°2; Osservatorio di Trieste = 0. Per ottenere la temperatura osservata, tali coefficienti vanno sottratti dal valore della temperatura media riportato nelle tabelle. Per esempio, la temperatura media vera del giorno 1 a Pola è di 10°7 — 0°2 = 10°5 che è quella dedotta dalle osservazioni.

(3) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

BACINO secondario	STAZIONI	Altezza s. l. m. metri	I. DECADE										II. DECADE										III. DECADE										Totale o media mensile	Giorni piovosi		Media quinquennale

NB. - Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) **Abbreviazioni:** a = aumento; d = diminuzione; r = regolare; i = irregolare; c = la pressione si mantiene quasi costante ed è soggetta alla sola variazione giornaliera (V. pag. 4).

(2) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Udine = + 1.°0 (Vedi es. a pag. 4).

(3) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

(4) Le osservazioni vennero eseguite alla ora 8

NB. - Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Belluno = + 2°6. (Vedi es. a pag. 4).

(2) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

BACINO secondario	STAZIONI	Altezza s. l. m. metri	I. DECADE										II. DECADE										III. DECADE										Totale o media mensile	Giorni piovosi		Media quinquennale								
																																		da 0,5 a mm. 3,0	super. a mm. 3,0	Altezza pioggia	Giorni piovosi

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Bassano = + 0° 9'. (Vedi esempio a pag. 4).

(2) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

STAZIONI	Altezza s. l. m. metri	I. DECADE										II. DECADE										III. DECADE										Totale o media mensile	Giorni piovosi		Media quinquennale

**A** = Precipitazioni meteoriche in millimetri

## Elementi per la conoscenza della secchezza del terreno

NB. - Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Vicenza = + 0°,4 (Vedi esempio a pag. 4).

(2) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

(3) Le osservazioni vennero eseguite alle ore 9.

STAZIONI	Altezza s. l. m. metri	I. DECADE										II. DECADE										III. DECADE										Totale o media mensile	Giorni piovosi		Media quinquennale					
																																	da 0.5 a mm. 2.9		super. a 3.0 mm.		Altezza pioggia		Giorni piovosi

NB. - Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Abbreviazioni: a = aumento; d = diminuzione; r = regolare; i = irregolare; c = la pressione si mantiene quasi costante ed è soggetta alla sola variazione giornaliera (Vedi pag. 4).

(2) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Treviso = + 0.2 (Vedi es. a pag. 4).

(8) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

STAZIONI	Altezza s. l. m. metri	I. DECADE										II. DECADE										III. DECADE										Totale o media mensile	Giorni piovosi		Media quinquennale

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Abbreviazioni: a = aumento; d = diminuzione; r = regolare; i = irregolare; c = la pressione si mantiene quasi costante ed è soggetta alla sola variazione giornaliera (Vedi pag. 4).

(2) Il coefficiente di riduzione al mare della temperatura è il seguente: Osservatorio di Rovigo = + 0°2 (Vedi esempio a pag. 4).

(3) La piovosità è espressa in gradi come segue: 1° grado = 1-5 mm.; 2° grado = 6-10 mm.; 3° grado = 11-15 mm.; ecc.

# 1. Diario delle condizioni idrografiche e meteorologiche del mese (vedi pag. 2).

Al primo del mese troviamo ancora nelle sue linee generali la configurazione riscontrata alla fine del precedente, ossia una Depressione abbastanza estesa sull'Europa centrale e Pendio da Sud sull'Italia, e quindi continuano le piogge; queste si interrompono al giorno dopo, quando sulla Svizzera e Baviera si stende un nucleo anticiclonico, dipendenza del promontorio spinto dall'Anticiclone che sin dal giorno precedente si trovava sull'Inghilterra. Intanto il ciclone dall'Europa centrale era passato in Ungheria, collegandosi con una Saccatura che sull'Italia era venuta a sostituire il Pendio.

Al 3 succede una rapida trasformazione della situazione: la regione veneta passa sotto l'influenza di un ciclone apparso sulla Manica, il quale, nel suo spostamento verso-levante, al 4, passa sull'Olanda, al 5 e 6 nel Golfo di Riga e di là s'allontana verso Nord. Sembra che da questo sia indipendente il ciclone che intanto (al 6) s'era scavato a 752 nell'Arcipelago Toscano e di cui non troviamo traccia il giorno dopo.

Nuova interruzione delle piogge il 7, per essersi costituito un nucleo anticiclonico a Nord d'Italia sulla Baviera, che ha elevato la pressione sulla Regione (Venezia 760.6). Questo nucleo è dipendenza del Promontorio spinto dall'Anticiclone delle Canarie sin dal giorno precedente.

Riprendono le piogge, leggere e limitate, il giorno dopo (l'8) quando il ciclone, che al 7 trovavasi a W dell'Inghilterra meridionale, è passato nel Belgio, dando luogo a pendio da Sud sull'Italia, leggermente perturbato da un debole secondario sulla Toscana. Mentre il 9 il ciclone principale si trasporta rapidamente nel Baltico, sulla Val Padana si delinea una saccatura da Levante.

Nuovamente e rapidamente il 10 avviene una trasformazione nella configurazione isobarica, alla quale consegue un rapido rinforzo e diffondersi delle piogge: l'Italia passa sotto l'azione di una saccatura che taglia la Toscana e le Marche, dipendenza di Ciclone centrato nel Golfo di Guascogna. E le piogge continuano nel giorno seguente quando il Ciclone principale, spostatosi sulla Manica, si collega con un secondario sulla Riviera di Levante.

Ma al 12 cessa questo lungo periodo umido caratterizzato da frequenti e forti variazioni della configurazione generale. Il cambiamento s'inizia per essersi attenuato notevolmente il secondario, e comparso altro ciclone sull'Ungheria, ma più che tutto, ritengo, per la formazione di un nucleo anticiclonico sul massiccio Alpino centrale, con un aumento della pressione; il periodo asciutto dura fino al 16. Durante questo periodo l'Italia trovasi in una striscia di Alta pressione, che congiunge probabilmente l'Anticiclone dei tropici con quello della Russia e Siberia.

Alla notte dal 16 al 17 cominciano le piogge, e ciò quando il Ciclone che nel suo movimento da Sud a Nord sulle coste Europee, è passato a 750 sulla Norvegia e attraverso ad una lunga e stretta saccatura da NNE si congiunge a un ciclone secondario sul Golfo di Genova. Nei giorni successivi il ciclone secondario lentamente si sposta sin sull'Arcipelago Toscano (18), mentre il Ciclone principale dalla Norvegia settentrionale (il 17), attraverso la Finlandia (il 18), scende in seguito più a Sud, nel cuor della Russia. Di qui il 20 manda una larga saccatura da Est sull'Italia; in seguito sulla carta d'Europa non ne troviamo più traccia.

Intanto, per il tempo della nostra regione, dobbiamo rivolgere l'attenzione ad una depressione che, nel suo spostamento verso Levante, dal 22 al 23, si mantiene collegata con un ciclone nel Tirreno apparsovi già sin dal 21. Al 24 il Ciclone settentrionale principale, spostatosi a SE nella Scozia, interessa l'Italia con una saccatura da Est, e poi il 25 passa nel Mar del Nord, mentre un ciclone secondario si centra sulla Toscana Emilia a mm. 750.

Il 26 all'affermarsi del promontorio sulla Svizzera Austria mandato dall'Anticiclone delle Azzorre, e a cui consegue un aumento di pressione sulla regione (da 751.5 il 25, passa a 755.4 il 26), ma più che tutto ritengo all'essere passato il ciclone secondario nel Basso Adriatico, devesi ascrivere una breve interruzione nelle piogge. Queste riprendono più copiose nei giorni successivi 27, 28, 29 sotto l'azione di un ciclone che dall'Olanda (26)

passa sullo Jutland (il 27) e sulla Norvegia (il 28 e 29). In questi giorni (26, 27, 28) un ciclone secondario debole s'era mantenuto sul Golfo di Genova; al 29 la situazione isobarica subisce una modificazione profonda, poichè appare un ciclone importante vicino allo stretto di Gibilterra; al tipo XV si pensa subito per la classificazione, ma gli si deve riconoscere una certa affinità al IV poichè è collegato con altro ciclone settentrionale. Questo ciclone mediterraneo dopo avere attraversato la Provenza il 29 sera, passa a formare il 30 un ciclone lungo e stretto centrato dall'alta Valle del Rodano alla Baviera, mentre sull'Italia si stende un pendio da Sud, e una saccatura da Sud si protende verso il Mar del Nord.

## 2. Periodi asciutti e periodi piovosi.

In questo mese si contano 8 giorni asciutti e 22 piovosi. Di questi solo tre furono a precipitazioni limitate, negli altri le precipitazioni caddero su tutta o quasi tutta la regione.

Sino all'11 del mese continua il periodo umido iniziatosi il 20 del mese precedente; sono 22 giorni a piogge generali, tranne 7 a piogge parziali (dal 27 al 31 del mese scorso e il 6, l'8 e il 9 del presente mese) e due giorni (il 2 e il 7) che si possono ritenere come asciutti, quantunque qua e là, in qualche bacino, siano cadute delle gocce.

Dal 12 al 16 si svolge un breve periodo asciutto; è l'unico del mese.

Al 16 verso le 22<sup>h</sup> s'inizia un periodo umido che va sino alla fine del mese a piogge generali, tranne il 26 completamente asciutto, a cui però seguirono i giorni con precipitazioni più abbondanti del mese.

## 3. Fenomeni notevoli.

TEMPERATURA. La temperatura in tutta la regione dall'11, per il cielo sereno, e per i venti del 3° quadrante, svelatici dai lanci di piloti di quei giorni e dall'anemometro del Venda, provenienti da regioni calde, è andata progressivamente aumentando, sino a raggiungere un massimo, che sul Venda si verifica il giorno 15 con 13°9 alle ore 8, in pianura (a Padova, Rovigo, Venezia ecc.) l'aumento invece si arresta il 14, ed al 15 ovunque la temperatura è minore, restando così essa al disotto di quella del Venda (a Padova sono 10°6); si ha pertanto una inversione termica di 3°1. Trattasi di un'inversione notturna d'irraggiamento, che ha dato luogo a nebbia in pianura. Difatti il grado di nebulosità ch'era stato 10/10 dall'8 al 13, e 4/10 al 14, al mattino del 15 è 1/10; il vento a Padova è Nord 1 m/s, sul Venda WSW 5 m/s.

Un'altra inversione (di 0.3) si era verificata il mattino del 7, anche in quel giorno con nebulosità 1/10 al Venda, e vento ancor più debole, dunque con la stessa spiegazione.

Differente è la causa dell'inversione termica del giorno 26 (7°8 a Padova, 8°7 al Venda), in cui il cielo rimase completamente coperto. In alto, verso i 500 m., spiravano venti di SSW, provenienti da regioni calde, i quali, rispetto ai venti di ENE del giorno precedente, apportarono un rapido riscaldamento: la loro azione fu più debole in pianura perchè ivi vi regnava quasi calma.

Son queste le uniche inversioni del mese; dello scarso numero di tali inversioni, oltre che nell'alta nebulosità (il Venda ha segnato 10/10 per 19 volte, 7 volte oltre il 5, una volta 4 e 3 volte 1), devesi cercare la causa anche nel fatto che l'osservazione delle ore 8, in questo mese, dista molto dalla levata del sole. Difatti questa avviene alle 5<sup>h</sup>50 al 1° del mese, e alle 5<sup>h</sup> all'ultimo.

I confronti vengono fatti tra le misure eseguite nell'Osservatorio sul Colle Venda a m. 577 s. l. m. e quelle eseguite nell'Osservatorio a Padova a m. 14 s. l. m., fuori porta S. Giovanni, distanti in linea d'aria Km. 17. Tutti e due gli osservatori sono stati costruiti espressamente dall'Ufficio Idrografico, e i termometri sono installati in capannina ben ventilata a m. 2.80 dal suolo. Le misure quindi sono strettamente comparabili. Essendo il Venda la cima più alta degli Euganei, le osservazioni in esso eseguite si possono considerare con molta approssimazione quelle della libera atmosfera, come ne fa fede anche l'accordo sufficiente tra le misure del vento eseguite con l'anemometro sul Venda e quelle eseguite a quella quota col palloncino pilota a Padova.

## 4. Riassunto e conclusioni.

Anche in questo mese, come nel precedente, il totale mensile delle precipitazioni riuscì notevolmente superiore alla media del quinquennio 1911-15 (pubbl. 69 di quest'Ufficio). Tale totale superò la media di oltre il 400% nel bacino dell'Isonzo (S. Wolfango 415%), e in quello del Tagliamento (Villa Santina 404%), superò di oltre il 200% nel bacino della Livenza (Tramonti di Sotto 258%), della Piave, nella pianura orientale, nel bacino della Brenta e in quello dell'Adige, superò di oltre il 150% nel bacino del Po, del Bacchiglione, dell'Agno-Guà, e in quasi tutta la pianura occidentale e in quella polesana. Solo in qualche luogo in pianura rimase sotto alla media, come a Ficarolo (90%) e Passo di Riva (80%).

Come quantità assolute mensili massime vanno ricordati i mm. 657 di Montemaggiore e i 515 di Wolfango.

Sulla parte montuosa della regione le precipitazioni furono accompagnate da nevicata, ma, sempre e ovunque, in quantità piccola, tanto che lo strato di neve generalmente è diminuito, e solo a forti altitudini, nel bacino dell'Adige, aumenta in relazione all'ultimo periodo di nevicata, arrivando a m. 2.74 allo Schneeberg sul Passer (m. 2882).

Come nel precedente, anche in questo mese, non molto accentuata è stata l'ampiezza dell'oscillazione della pressione atmosferica in Europa, difatti il valore massimo della pressione fu di mm. 777 sulle coste Atlantiche il 18, e il minimo fu di mm. 738 il 26 sull'Olanda, e il 27 sullo Jutland.

Nella regione veneta la pressione ha superato i 760 mm. in soli sette giorni, ossia il 7, inoltre nei quattro giorni asciutti 13, 14, 15, 16, e infine il 23 e 24; in tutti gli altri giorni la pressione si mantenne sotto il 60. Scese sotto il 50 il giorno 4; in questo giorno si verificò il minimo del mese con mm. 45.6 a Udine, mentre il massimo si ebbe il 14 a Trieste con 68.6.

Le relazioni tra i tipi isobarici e le precipitazioni nella regione si possono riassumere nella seguente tabella:

GIORNI	TIPI ISOBARICI									
	III	II	I	IV	V	VI	VII	VIII	IX	*
Con precipitazioni generali . . . .	8	9	1	1	1	—	—	1	2	1
Con precipitazioni parziali . . . .	—	1	1	—	—	—	—	1	—	—
Senza precipit. . . . .	—	2	—	—	—	1	4	—	1	—
Totale	8	12	2	1	1	1	4	1	3	1

(\*) Ciclone sul Golfo di Guascogna con Saccatura da W sull'Italia centrale.

Troviamo dunque che:

I. Le piogge generali sulla regione veneta in questo mese di aprile si verificarono con una delle situazioni seguenti:

con centro ciclonico tra NW e NE d'Italia, mentre sulla penisola si stende un pendio da Sud, oppure mentre sul Tirreno o nella regione veneta esiste un ciclone secondario, oppure mentre l'Italia è tagliata da una saccatura più o meno ampia da Levante;

inoltre con centro ciclonico sul Tirreno;

infine con centro ciclonico nel Mediterraneo occidentale.

II. Le piogge vengono interrotte tutte le volte che sulle Alpi centrali o subito a Nord di queste si forma un nucleo anticiclonico.

I principali corsi d'acqua della regione veneta si mantennero in questo mese generalmente in morbida o in magra ordinaria.

Dal giorno 27 al 30 un gruppo di forti piogge cadute sui bacini dell'Isonzo e del Tagliamento contribuì ad ingrossare la portata di questi fiumi, che salirono rapidamente in piena, raggiungendo il massimo livello il 30 e ritornando in morbida il 1 maggio.

#### Le piene del Tagliamento dal 28 al 1 maggio

La piena del Tagliamento è illustrata nelle due tabelle seguenti, che raccolgono i dati orari, e gli incrementi e decrementi orari, medi e massimi per il periodo in cui il fiume si mantenne, all'idrometro di Venzona, sopra il segno di guardia. Questa piena risulta la più notevole fra quelle avvenute nel Tagliamento durante i mesi di aprile del periodo 1911-22.

#### Altezze orarie del livello durante la piena

NB. — Come è noto la velocità che il vento imprime alle coppe della crociera dell'anemografo, velocità che è registrata nel diagramma, è inferiore alla velocità reale. Per passare dalla velocità registrata a quella reale, occorre perciò applicare un coefficiente maggiore dell'unità e che viene determinato in base a molte osservazioni di confronto con un anemografo campione. Il coefficiente non è costante, variando entro certi limiti colla velocità.

Coefficienti di riduzione dell'anemografo Steffens-Marini per Venezia: Per velocità orarie del vento fra 4 e 8 km. ora: coefficiente da applicare = 1,4; per velocità orarie del vento fra 8 e 12 km. ora: coefficiente da applicare = 1,3. Tali coefficienti devono applicarsi alle velocità indicate nella tabella, che sono quelle lette sui diagrammi, per ottenere la velocità reale.

Latitudine Nord: 45° 19'; Longitudine 0° 46' W da Roma

Direzione e velocità oraria del vento; direzione, velocità e durata del vento prevalente; temperatura, umidità relativa e nebulosità media giornaliera

Altezza degli anemometri sul livello del mare m. 601; sul suolo m. 26 — Altezza della capanna termopsicrometrica sul livello del mare m. 577

N.B. — I saggi d'acqua vengono raccolti nel filone della corrente; la torbidità viene determinata col metodo descritto nella 9ª Relazione annuale del Direttore (1917) e indicata coi grammi di materie in sospensione contenuti in 1000 grammi d'acqua.

NB. — Vedi le avvertenze generali a pag. 24.

## Avvertenze generali

Tutte le altezze e le escursioni di marea pubblicate nel bollettino sono date in centimetri e sono riferite ad un piano ideale di base situato a m. 1,50 sotto il livello medio fondamentale del mare (si ottengono così nelle altezze di marea dei valori sempre positivi). I tempi sono calcolati sul tempo medio dell'Europa centrale. I dati di marea si riferiscono alle stazioni mareografiche di Pola, (entro il porto omonimo), di Trieste, (in mare aperto), di S. Nicolò di Lido (entro il porto di Lido), Viesti (in mare aperto).

I dati sottolineati si riferiscono ad osservazioni influenzate da ondulazioni secondarie di una certa entità.

Le quote dei bulloni di riferimento per i mareografi dell'estuario veneto furono determinate in base alla livellazione, già ultimata, di un poligono che abbiamo chiamato fondamentale, appoggiato su capisaldi di partenza su roccia in posto, non soggetti perciò a fenomeni di costipamento o di assettamento del terreno. A tale poligono furono collegate le piastine dei principali mareografi in funzione nell'estuario veneto.

I dati dei mareografi di Pola e Trieste sono riferiti al livello medio locale determinato ri-

spettivamente dall'ex Osservatorio marittimo di Trieste e dall'ex Istituto Idrografico della Marina austro-ungarica di Pola.

In tal modo possiamo dare le altezze di marea, non più misurate su un piano ideale di riferimento, ma riferite addirittura al livello medio del mare, che abbiamo assunto come fondamentale, in prima approssimazione, in attesa di stabilirlo definitivamente, in base a lunghe serie di osservazioni mareografiche.

Tabella I. — La tabella prima dà i valori massimo e minimo raggiunti dal livello del mare nel mese, con le relative escursioni.

Tabella II. — La tabella seconda dà i massimi e minimi valori raggiunti dal livello medio diurno del mare nel mese e quindi le massime escursioni mensili del livello medio stesso.

Tabella III. — La tabella terza dà la massima ampiezza di marea osservata nel mese sia fra alta e bassa come fra bassa ed alta marea, consecutive.

Tabella IV. — La tabella quarta dà la minima escursione giornaliera del livello verificatasi nel mese.

TABELLA I.  
Massima escursione del livello nel mese

## Ondulazioni secondarie

In questo mese si verificarono ondulazioni secondarie forti nei giorni 29 e 30 a Pola, Trieste e Viesti ed ondulazioni secondarie leggere nei giorni 1, 4, 5, 7, 10, 11 e 25 a Pola, nei giorni 1, 4, 5, 11, 25, 27 e 28 a Trieste, nei giorni 28 e 29 a S. Nicolò di Lido e nei giorni dall'1 all'11 e dal 25 al 28 a Viesti.

## BOLLETTINO MENSILE - MAGGIO 1922

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Boite a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Mincio a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richiesto per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero, ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24<sup>h</sup>. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene dedotta mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbidità media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Per avere l'effettivo contributo in litri per km.<sup>2</sup> deve essere però anche considerata la portata del canale di derivazione per l'irrigazione dell'alto Agro Veronese, che non è compresa nella portata misurata a Pescantina.

(2) Per ottenere l'effettivo contributo in litri per km.<sup>2</sup> deve essere anche considerata l'acqua derivata nell'Adigetto a Badia Polesine e le derivazioni minori. Le indicazioni per tenerne conto saranno pubblicate in uno dei prossimi bollettini.

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

## Notizie sulle piene e sulle magre dei fiumi

In questo mese quasi tutti i fiumi della Regione Veneta si mantennero, con piccolissime variazioni del livello, in leggera morbida od in magra ordinaria. Tale fatto è in relazione alla generale mancanza di precipitazioni e alla scarsa riserva di neve in montagna.

Questo mese infatti, che è generalmente caratterizzato da forti piogge che raggiungono uno dei valori massimi annuali, si presenta invece in quest'anno con totali di pioggia che si scostano fortemente dalla somma mensile media (133 mm. per l'intera regione veneta - quinquennio 1911-15).

Continua e si accentua in questo mese lo scioglimento del mantello di neve nei bacini montani della regione; l'effetto si riscontra specialmente nell'Adige che aumenta lentamente e progressivamente per quasi tutto il mese, sorpassa il 22, nel suo corso medio, il segno di guardia e si mantiene in piena fino al 31.

Questa piena, l'unica verificatasi in maggio, è però di assai lieve entità e raggiunge altezze massime molto limitate (16 cm. sopra il segno di guardia a Verona, 34 cm. sopra la guardia a Boara Pisani).

## La piena dell'Adige dal 22 al 31 maggio

La piena suddetta viene illustrata nelle tabelle seguenti che raccolgono gli elementi principali che la caratterizzano, relativi all'idrometro di Boara Pisani; nell'ultima tabella vengono poi raccolti alcuni dati che permettono un confronto con le piene avvenute nell'Adige nel decennio 1911-20.

N.B. — I saggi d'acqua vengono raccolti nel filone della corrente; la torbidità viene determinata col metodo descritto nella 9ª Relazione annuale del Direttore (1917) e indicata coi grammi di materie in sospensione contenuti in 1000 grammi d'acqua.

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Boite a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Mincio a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richiesto per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero, ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24 ore. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene dedotta mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbida media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Per avere l'effettivo contributo in litri per km.<sup>2</sup> deve essere però anche considerata la portata del canale di derivazione per l'irrigazione dell'alto Agro Veronese, che non è compresa nella portata misurata a Pescantina.

(2) Per ottenere l'effettivo contributo in litri per km.<sup>2</sup> deve essere considerata anche l'acqua derivata nell'Adigetto a Badia Polesine e le derivazioni minori. Le indicazioni per tenerne conto saranno pubblicate in uno dei prossimi bollettini.

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

L'Isonzo, il Tagliamento, la Livenza, la Piave e la Brenta si mantennero in quasi tutto il mese in debole morbida, che si accentuò solo nei giorni 18-19 e 26-27 in corrispondenza a due gruppi di piogge generali, a carattere temporalesco, abbastanza forti.

Il Bacchiglione oscillò intorno alla morbida fino alle ore 12 del 25; le piogge notevoli di questo giorno lo ingrossarono assai rapidamente, sì da portarlo, dopo tre ore, sopra la guardia; la piena fu però di brevissima durata (quattro ore circa) ed il livello massimo non fu che di 8 cm. sopra la guardia, all'idrometro di Borgo Berga, con un dislivello di m. 1.14 in quattro ore.

Il Frassine si mantenne in magra fino alla sera del 25; anche questo corso d'acqua risentì rapidamente l'effetto dei forti acquazzoni verificatisi nella mattina e nel pomeriggio del 25, salendo in poche ore in piena e raggiungendo alle ore 4 del 26 il livello massimo (m. 0.40 all'idrometro di Borgo Frassine); la piena, di breve durata e di lievissima entità, venne risentita anche nel Canale di S. Caterina che salì a 8 cm. sopra la guardia all'idrometro di Pra d'Este alle ore 13 dello stesso giorno.

L'Adige nel suo corso inferiore si mantenne in morbida accentuata e quasi stazionario fino al 12; in questo giorno un debolissimo incremento lo portò in piena, che, arrivata soltanto a pochi centimetri sopra la guardia, durò fino al giorno successivo. Il fiume decrebbe poi, con leggere oscillazioni del livello, per tutto il mese, arrivando negli ultimi giorni alla linea di magra ordinaria.

### Le piene del Frassine e dell'Adige avvenute nel mese di giugno

Le piene del Frassine e dell'Adige vengono illustrate particolarmente nelle tabelle seguenti che raccolgono le altezze orarie del livello e gli incrementi e decrementi orari, medi e massimi per gli idrometri di Borgo Frassine, per il Frassine, e di Masi e Boara Pisani, per l'Adige.

Giova notare che la piena dell'Adige venne avvertita nel solo tratto da Verona al mare. A monte di Verona il livello si mantenne, a tutti gli idrometri, sotto il segno di guardia.

In una tabella a parte vengono riassunti, per i due corsi d'acqua suddetti, gli elementi caratteristici delle principali piene avvenute nei mesi di giugno del decennio 1911-1920.

N.B. — I saggi d'acqua vengono raccolti nel filone della corrente; la torbidità viene determinata col metodo descritto nella 9ª Relazione annuale del Direttore (1917) e indicata coi grammi di materie in sospensione contenuti in 1000 grammi d'acqua.

## SEGN I CONVENZIONALI

(n), precipitazioni avvenute sotto forma di neve non misurata; \*\*, lo strumento non ha funzionato; », non giunte le osservazioni - dato mancante o non calcolato; ?, dato incerto; (\*), dato desunto dallo strumento a lettura diretta, invece che dal registratore; \*, pluviografo, idrometrografo; +, pluviometro: salvo indicazioni in contrario, nei totali sono considerate anche le precipitazioni avvenute sotto forma di neve; °, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione.

Avvertenze - Nella parte B degli «Elementi idrografici» i valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese. Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere ordinario sono sopra lo zero idrometrico; quelle stampate in carattere minuscolo sono sotto lo zero idrometrico.

IL DIRETTORE  
GIOVANNI MAGRINI

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti:																	

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Boite a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Mincio a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richiesto per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero, ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24 ore. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene dedotta mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbida media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Per avere l'effettivo contributo in litri per km.<sup>2</sup> deve essere però anche considerata la portata del canale di derivazione per l'irrigazione dell'alto Agro Veronese, che non è compresa nella portata misurata a Pescantina.

(2) Per ottenere l'effettivo contributo in litri per km.<sup>2</sup> deve essere considerato anche l'acqua derivata nell'Adigetto a Badia Polesine e le derivazioni minori. Le indicazioni per tenerne conto saranno pubblicate in uno dei prossimi bollettini.

In questo mese, in relazione alla scarsa quantità di pioggia caduta sulla regione veneta, i fiumi si mantennero quasi stazionari, oscillando generalmente intorno alla linea di magra.

Nei soli bacini montani del **Tagliamento** e della **Piave** assunsero una notevole entità i temporali verificatisi dalla sera del 15 al mattino del 16, accompagnati da rovesci di pioggia che contribuirono ad ingrossare rapidamente i due corsi d'acqua. Il **Tagliamento** a Venzona, da m. 0.50 alle ore 1.50 del 16 si portò a m. 1.14 alle ore 3.50, sorpassando di 14 cm. il segno di guardia; diminuì poi fino alle ore 7 per aumentare ancora leggermente fino a m. 1.06 alle ore 11.30; decrebbe quindi continuamente ritornando nel giorno successivo in debole morbida. La **Piave** si portò in morbida accentuata arrivando a m. 0.75 all'idrometro di Perarolo alle ore 7 del 16, con un incremento di 60 cm. in ore 9.30 circa; decrebbe quindi lentamente ritornando in morbida nei giorni successivi.

L'**Adige** nel suo corso inferiore, si mantenne in morbida, con tendenza a diminuire, fino al 16; in questo giorno un aumento abbastanza notevole lo portò in morbida accentuata e, il 17, in piena, che però ebbe brevissima durata e raggiunse altezze massime del livello molto limitate; nel giorno successivo il fiume ritornò in morbida, diminuendo poi lentamente fino al 31.

### La piena dell'Adige avvenuta nel mese di luglio

Le due tabelle seguenti raccolgono gli elementi caratteristici della piena dell'**Adige** avvenuta dal 17 al 18 luglio, mentre la terza tabella permette il confronto con gli stessi elementi raccolti per le principali piene avvenute nello stesso mese durante il periodo 1911-1920.

#### Altezze orarie del livello durante la piena

N.B. — I saggi d'acqua vengono raccolti nel filone della corrente; la torbidità viene determinata col metodo descritto nella 9ª Relazione annuale del Direttore (1917) e indicata coi grammi di materie in sospensione contenuti in 1000 grammi d'acqua.

## Misure di portata eseguite durante il mese

Bacino		Giorno	Corso d'acqua	Località	Idrometro	Altezza Idrometrica	Sezione liquida in m. q.	Portata m. c. al secondo
Princi- pale	Secun- dario							
Adige		1	Adigetto	Badia Polesine	di stazione al contrasostegno	0.50 1.80	15.7	9.7
Piave	Boite	9	Boite	Perarolo	di stazione all'idrometrografo	0.41 0.28	8.8	8.9

## SEGNI CONVENZIONALI

(n), precipitazioni avvenute sotto forma di neve non misurata; \*\*, lo strumento non ha funzionato; », non giunte le osservazioni - dato mancante o non calcolato; ?, dato incerto; (\*), dato desunto dallo strumento a lettura diretta, invece che dal registratore; +, pluviometro: salvo indicazioni in contrario, nei totali sono considerate anche le precipitazioni avvenute sotto forma di neve; °, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione.

Avvertenze - Nella parte A degli «Elementi idrografici» le stazioni pluviografiche e idrometrografiche sono stampate in carattere grassetto. — Nella parte B i valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una grappa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese. Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere ordinario sono sopra lo zero idrometrico; quelle stampate in carattere minuscolo sono sotto lo zero idrometrico.

IL DIRETTORE  
GIOVANNI MAGRINI

Contributo in litri per km. <sup>2</sup>	Media mensile	24.3			18.9			20.3 (1)					18.2 (2)			24.4	
	Massimo del mese	29.4			26.5			29.2					25.1			25.2	
	Minimo del mese	19.9			14.6			15.9					14.3			23.0	

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Boite a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Mincio a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richieste per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero, ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24 ore. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene dedotta mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbida media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Per avere l'effettivo contributo in litri per km.<sup>2</sup> deve essere però anche considerata la portata del canale di derivazione per l'irrigazione dell'alto Agro Veronese, che non è compresa nella portata misurata a Pescantina.

(2) Per ottenere l'effettivo contributo in litri per km.<sup>2</sup> deve essere considerata anche l'acqua derivata nell'Adigetto a Badia Polesine e le derivazioni minori. Le indicazioni per tenerne conto saranno pubblicate in uno dei prossimi bollettini.

## Notizie sulle piene e sulle magre dei fiumi

In questo mese i fiumi della Regione si mantennero generalmente in magra. Soltanto l'Adige, in morbida dal mese di luglio, restò in tutto il mese sopra il segno di magra ordinaria, aumentando leggermente nei primi giorni della prima e della seconda decade.

## La magra della Brenta durante il mese di agosto

Allo scopo d'illustrare particolarmente la magra della Brenta vengono raccolte nella tabella seguente le altezze del livello registrate di sei in sei ore agli idrometrografi di Sarson di Bassano e di Limena.

Corsi d'acqua e Idrometri	Altezza della magra ordinaria	Ore	GIORNI																															Livello minimo

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Boite a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Mincio a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richiesto per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero, ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24 ore. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene dedotta mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbida media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Per avere l'effettivo contributo in litri per km.<sup>2</sup> deve essere però anche considerata la portata del canale di derivazione per l'irrigazione dell'alto Agro Veronese, che non è compresa nella portata misurata a Pescantina.

(2) Per ottenere l'effettivo contributo in litri per km.<sup>2</sup> deve essere considerata anche l'acqua derivata nell'Adigetto a Badia Polesine e le derivazioni minori. Le indicazioni per tenerne conto saranno pubblicate in uno dei prossimi bollettini.

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

(1) Le osservazioni vennero eseguite a Sterzing, Zwischenwasser e Pflaurenz alle ore 7; a Mittewald e Bressanone alle ore 8; a Glorenza alle ore 11.

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

## Notizie sulle piene e sulle magre dei fiumi

In relazione a due gruppi di piogge abbastanza forti, il primo nel giorno 12 ed il secondo nei giorni 27 e 28, si ebbero in tutti i fiumi due sensibili aumenti di livello dei quali il primo fu, in generale, il più accentuato.

Nel resto del mese i corsi d'acqua si mantennero in magra o in leggera morbida.

## La piena dell'Adige dal 13 al 14 settembre

Le piogge del giorno 12 ingrossarono notevolmente l'Adige che, nel tratto da Badia Polesine al mare, si costituì in piena dal 13 al 14. Il livello del fiume, da m. - 1.31 alle ore 12 del 12, si portò a m. + 0.19 alle ore 7 del 14 all'idrometro di Boara Pisani; decrebbe quindi lentamente ritornando dopo poche ore in morbida. La piena, come si vede, fu di breve durata e di lieve entità.

Piave	Boite	19	Boite	Perarolo	di stazione	0.48	9.44
					all'idrometrografo	0.35	

## SEGN I CONVENZIONALI

(n), precipitazioni avvenute sotto forma di neve non misurata; \*\*, lo strumento non ha fun-  
\*, non giunte le osservazioni - dato mancante o non calcolato; ?, dato incerto; (\*), dato desun-  
strumento a lettura diretta, invece che dal registratore; +, pluviometro: salvo indica-  
contrario, nei totali sono considerate anche le precipitazioni avvenute sotto forma di neve; °, id-  
o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chius-  
sostegni di navigazione.

Avvertenze - Nella parte A degli «Elementi idrografici» le stazioni pluviografiche e idrometro  
sono stampate in carattere grassetto. — Nella parte B i valori massimi e minimi mensili vengono i  
parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massim-  
mento giornaliero verificatosi nel mese. Le altezze idrometriche sono sempre espresse in metri  
stampate in carattere ordinario sono sopra lo zero idrometrico; quelle stampate in carattere m-  
sono sotto lo zero idrometrico.

N.B. — I saggi d'acqua vengono raccolti nel filone della corrente; la torbidità viene determinata  
col metodo descritto nella 9ª Relazione annuale del Direttore (1917) e indicata coi grammi di materie in  
sospensione contenuti in 1000 grammi d'acqua.

Minimo del mese		19.9			24.3									25.2

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Boite a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Mincio a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richiesto per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero, ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24 ore. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene dedotta mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbidità media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Da questo mese è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.<sup>3</sup> 3 ed in primavera-estate i m.<sup>3</sup> 14. Calcolando per l'inverno una portata media di 2 m.<sup>3</sup> e per la primavera-estate di 10 m.<sup>3</sup> veniamo a commettere nel calcolo della portata integrale dell'Adige un'errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata.

(2) Da questo mese è anche considerata la portata derivata nell'Adigetto a Badia Polesine.

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

In relazione alle forti piogge dei giorni 6, 29 e 30 si notano in questo mese due sensibili aumenti di livello; il primo avvenuto dal 6 al 7 soltanto nei fiumi della regione orientale; il secondo dal 29 al 31 verificatosi in quasi tutti i corsi d'acqua della regione.

Negli altri giorni del mese il livello dei fiumi non subì che leggere oscillazioni, mantenendosi in magra o in leggera morbida.

#### Le piene del Tagliamento, del Bacchiglione e del Frassine dal 30 al 31 ottobre

In seguito alle forti piogge del giorno 29 e della notte tra il 29 e il 30 il **Tagliamento** s'ingrossò rapidamente, raggiungendo la guardia alle ore 7 del 30 all'idrometro di Venzona; aumentò quindi fino all'altezza di m. 1.20 sopra la guardia, alle ore 14 dello stesso giorno, con un incremento orario medio di cm. 16.4. S'iniziò poi la regolare decrescita delle acque che ritornarono in morbida nel giorno successivo. La piena venne risentita nel corso inferiore del fiume, dove il livello arrivò a m. 1.20 sotto la guardia all'idrometro di Latisana.

Anche nel **Bacchiglione** e nel **Frassine** si ebbero due rapide piene, che raggiunsero i livelli massimi rispettivi di m. 2.34 a Borgo Berga e m. 1.28 a Borgo Frassine.

(1) Fra i dati di torbidità se ne trovano alcuni che sembrano affetti da errore, o per lo meno singolari, perché non possono essere messi in relazione, almeno in una prima indagine, ad alcuna causa che li spieghi. — Non abbiamo però alcun motivo per stabilire che tali dati non sieno attendibili: preferiamo perciò di pubblicarli, richiamando su di essi l'attenzione del lettore.  
NB. — I saggi d'acqua vengono raccolti nel filone della corrente; la torbidità viene determinata col metodo descritto nella IX relazione del Direttore (1917) e indicata coi grammi di materie in sospensione contenuti in 1000 grammi d'acqua.

Venezia, dicembre 1922

		3	Can. Ledra . . . . .	Andreussa . . .	di stazione	1.99	14.69	17.6

(1) Le letture vengono eseguite a partire da un punto di riferimento; esse sono sempre negative.

## SEGNI CONVENZIONALI

(n), precipitazioni avvenute sotto forma di neve non misurata; \*\*, lo strumento non ha funzionato; \*, non giunte le osservazioni - dato mancante o non calcolato; ?, dato incerto; (\*), dato desunto dallo strumento a lettura diretta, invece che dal registratore; +, pluviometro: salvo indicazioni in contrario, nei totali sono considerate anche le precipitazioni avvenute sotto forma di neve; °, idrometro o idrometrografo posto in località ov'è sentito l'infusso della marea o dell'apertura o chiusura dei sostegni di navigazione.

Avvertenze - Nella parte A degli «Elementi idrografici» le stazioni pluviografiche e idrometrografiche sono stampate in carattere *grassetto*. — Nella parte B i valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese. Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono sopra lo zero idrometrico; quelle stampate in carattere *minuscolo* sono sotto lo zero idrometrico.

IL DIRETTORE  
GIOVANNI MAGRINI

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Boite a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Mincio a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richiesto per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero, ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24<sup>h</sup>. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene dedotta mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbidità media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Da questo mese è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.<sup>3</sup> 3 ed in primavera-estate i m.<sup>3</sup> 14. Calcolando per l'inverno una portata media di 2 m.<sup>3</sup> e per la primavera-estate di 10 m.<sup>3</sup> veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata.

(2) Da questo mese è anche considerata la portata derivata nell'Adigetto a Badia Polesine.

# Notizie sulle piene e sulle magre dei fiumi

I fiumi della Regione Veneta, dopo le leggere piene degli ultimi giorni di ottobre, decrebbero quasi continuamente per tutto questo mese, ritornando sotto il segno di magra ordinaria.

## Le magre della Brenta, del Frassine e del Gorzone durante il mese

Le magre più notevoli del mese si verificarono nei bacini della Brenta e dell'Agno - Frassine - Gorzone. Il livello di questi corsi d'acqua scese rispettivamente a m. 0.05 all'idrometro di Sarson di Bassano (Brenta), a m. - 2.51 a Borgo Frassine (Frassine) e a m. - 2.25 a Cà Dolfin (Gorzone).

Nella tabella seguente vengono raccolte le altezze del livello registrate agli idrometri suddetti durante tutto il mese. La seconda tabella contiene i dati caratteristici relativi alle principali magre avvenute nel mese di novembre del periodo 1911 - 20.

N.B. — I saggi d'acqua vengono raccolti nel filone della corrente; la torbidità viene determinata col metodo descritto nella 9ª Relazione annuale del Direttore (1917) e indicata coi grammi di materie in sospensione contenuti in 1000 grammi d'acqua.

Venezia, gennaio 1923

**Misure di portata eseguite durante il mese**

Bacino		Giorno	Corso d'acqua	Località	Idrometro	Altezza Idrometrica	Sezione liquida in m. q.	Portata m. c. al secondo
Princi- pale	Secun- dario							
Brenta		24	Brenta . . . . .	Sarson (Bassano)	di stazione	0.15	42.6	38.5
Alta pianura occid.		29	Can. Mirano . . . . .	Molinetti (1) . .	di Marano	0.64	18.8	1.27
		30	Veraro (2) . . . . .	Strà . . . . .	di stazione	0.76	7.8	3.6

(1) Gruppo di case in prossimità di Mira.

(2) Durante l'esecuzione della misura venne chiusa la briglia dei Salgarelli; nel valore della portata è quindi compresa anche l'acqua che defluisce normalmente nel Tergola, trascurando le piccole perdite d'acqua attraverso la briglia.

**SEGNi CONVENZIONALI**

(n), precipitazioni avvenute sotto forma di neve non misurata; \*\*, lo strumento non ha funzionato; \*, non giunte le osservazioni - dato mancante o non calcolato; ?, dato incerto; (\*), dato desunto dallo strumento a lettura diretta, invece che dal registratore; +, pluviometro: salvo indicazioni in contrario, nei totali sono considerate anche le precipitazioni avvenute sotto forma di neve; °, idrometro o idrometrografo posto in località ov'è sentito l'infusso della marea o dell'apertura o chiusura dei sostegni di navigazione.

Avvertenze - Nella parte A degli «Elementi idrografici» le stazioni pluviografiche e idrometrografiche sono stampate in carattere grassetto. — Nella parte B i valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese. Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere ordinario sono sopra lo zero idrometrico; quelle stampate in carattere minuscolo sono sotto lo zero idrometrico.

IL DIRETTORE  
GIOVANNI MAGRINI

# UFFICIO IDROGRAFICO DEL R. MAGISTRATO ALLE ACQUE - VENEZIA

## BOLLETTINO MENSILE - DICEMBRE 1922

Le sezioni caratteristiche scelte per la compilazione della presente tabella sono le seguenti: per un torrente di alta montagna: il Boite a Perarolo; per un fiume a regime torrentizio: la Brenta a Sarson, vicino a Bassano; per un grande fiume allo sbocco in pianura: l'Adige a Pescantina; per un grande fiume nel suo corso di pianura: l'Adige a Boara Pisani; per l'emissario di un lago: il Minolo a Peschiera.

Nel caso di leggere oscillazioni del livello, dato il grado di approssimazione richiesto per questi dati, si assume l'altezza idrometrica meridiana come valore medio giornaliero, ed in base ad esso si calcolano le corrispondenti portate unitarie, in metri cubi al secondo, e le portate integrali in milioni di metri cubi nelle 24 ore. Nel caso di notevoli variazioni di altezza nelle 24 ore, mentre viene dato il livello medio giornaliero ricavato dall'integrazione dei diagrammi idrometrografici, la portata totale, da cui si ricava poi la portata media, viene delottata mediante l'integrazione di una curva costruita per punti, in relazione alle diverse altezze idrometriche osservate nelle diverse ore.

In calce alla tabella viene dato il contributo di deflusso in litri per chilometro quadrato, calcolato per la portata unitaria massima, minima e media del mese.

Per l'Adige a Pescantina viene inoltre indicata giorno per giorno, la torbidità media in grammi per metro cubo ed il peso in tonnellate del materiale solido trasportato in sospensione dalle acque nelle 24 ore.

(1) Nella portata unitaria e integrale è anche considerata la portata del canale di derivazione per l'irrigazione dell'Alto Agro Veronese. Tale portata, variabile continuamente, in quanto è influenzata da numerose chiaviche di presa, non è possibile determinare giorno per giorno. Risulta però trattarsi di portate che non superano mai in autunno-inverno i m.<sup>3</sup> 3 ed in primavera-estate i m.<sup>3</sup> 14. Calcolando per l'inverno una portata media di 2 m.<sup>3</sup> e per la primavera-estate di 10 m.<sup>3</sup> veniamo a commettere nel calcolo della portata integrale dell'Adige un errore del tutto trascurabile, in relazione ai limiti di tolleranza che ci siamo proposti nelle misure di portata.

(2) Nella portata unitaria e integrale è anche considerata la portata derivata nell'Adigetto a Badia Polesine.

NB. — Nella testata della tabella le ultime quattro colonne sono state divise in due parti: i titoli della parte superiore si riferiscono alle "Precipitazioni meteoriche", e quelli della parte inferiore alle "Osservazioni idrometriche".

Nella prima e seconda decade i corsi d'acqua della Regione Veneta si mantennero pressochè stazionari, in magra o in leggerissima morbida.

Dal giorno 21 al 26 si ebbe un periodo di piena abbastanza notevole, verificatosi in quasi tutti i fiumi veneti, che raggiunsero altezze del livello piuttosto elevate. Questa piena è divisa in due curve distinte, la prima dal 21 al 23 col massimo valore nei giorni 21 e 22, la seconda dal 23 al 26, col massimo valore il 24. Risulta evidente la corrispondenza con due gruppi di forti piogge succedutisi nei giorni 20-21 e 23 su quasi tutta la Regione.

Per dare un'idea sull'entità della piena vengono riportati nella pag. 16 alcuni dati caratteristici per gli idrometri più importanti.

Dal giorno 26 al 31 i fiumi decrebbero continuamente, pur mantenendosi in morbida; il 31 in corrispondenza a piogge abbastanza forti dei giorni 30-31 si verificò nel **Tagliamento** un nuovo aumento di livello; il fiume a **Venezia** risalì sopra la guardia alle 9<sup>h</sup> del 31, raggiunse il livello massimo di m. 1.80 alle 18<sup>h</sup> e ritornò in morbida nel giorno seguente.

**Le piene della Livenza e della Brenta dal 21 al 26 Dicembre**

Le tabelle seguenti raccolgono le altezze del livello e gli incrementi e decrementi relativi per tutto il tempo in cui i fiumi suddetti rimasero sopra il segno di guardia.

Nei decenni 1911-20 si verificò nei fiumi suddetti una sola piena nel dicembre 1916; essa raggiunse i livelli massimi di m. 1.46 sopra la guardia a Motta (Livenza) e m. 1.23 sopra la guardia a Corte (Brenta).

### Altezze orarie del livello durante la piena

N.B. — I saggi d'acqua vengono raccolti nel filone della corrente; la torbidità viene determinata col metodo descritto nella 9<sup>a</sup> Relazione annuale del Direttore (1917) e indicata coi grammi di materie in sospensione contenuti in 1000 grammi d'acqua.

### SEGNALI CONVENZIONALI

(n), precipitazioni avvenute sotto forma di neve non misurata; \*\*, lo strumento non ha funzionato; \*, non giunte le osservazioni - dato mancante o non calcolato; ?, dato incerto; (\*), dato desunto dallo strumento a lettura diretta, invece che dal registratore; +, pluviometro: salvo indicazioni in contrario, nei totali sono considerate anche le precipitazioni avvenute sotto forma di neve; °, idrometro o idrometrografo posto in località ov'è sentito l'influsso della marea o dell'apertura o chiusura dei sostegni di navigazione.

**Avvertenze** - Nella parte A degli «Elementi idrografici» le stazioni pluviografiche e idrometrografiche sono stampate in *carattere grassetto*. — Nella parte B i valori massimi e minimi mensili vengono posti fra parentesi, mentre vengono compresi da una graffa i due valori consecutivi che danno il massimo incremento giornaliero verificatosi nel mese. Le altezze idrometriche sono sempre espresse in metri; quelle stampate in carattere *ordinario* sono *sopra* lo zero idrometrico; quelle stampate in carattere *minuscolo* sono *sotto* lo zero idrometrico.

IL DIRETTORE  
GIOVANNI MAGRINI
